

Renewable energy

We burn fossil fuels to release energy and make electricity, but fossil fuels are resources that will run out one day. Energy made using resources that won't run out is called renewable energy. There are many sources of renewable energy, for example, wind, sunlight, and the tides.

Solar

Light energy from the Sun is changed into electrical energy using solar panels. A different kind of panel can be used to heat water.

Hydroelectric

The potential energy of water trapped behind a dam can be made into electricity when the water is released and flows over a turbine.

Tidal

The tides are the rise and fall of the sea. This movement of water can push an underwater turbine in the same way wind pushes a wind turbine.
