

Where did they live?

Early in the Stone Age, the first people spread out from Africa to Europe and Asia. Eventually, over thousands of years, early people traveled across the world. They adapted to different environments, from the freezing Arctic to the hot, dry climate of Australia.

Settlers in Greenland hunted sea birds.

1 Greenland

People who settled in Greenland learned to hunt and find food in freezing ocean waters. They made boats and special tools for hunting in the ocean. Even today, some people still follow some of the same traditions.

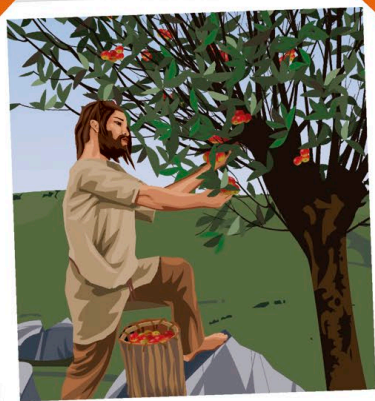

People in South America hunted llama and deer with stone tools.

2 Americas

North and South America are known as the Americas. These were the last areas to be settled. People spread across both continents, some living as hunter-gatherers, others as farmers.

3 Europe

People arrived in mainland Europe about 40,000 years ago. They reached the British Isles much later—near the end of the last Ice Age, around 10,000 years ago. These early Europeans had to cope with icy glaciers and very cold weather.

People in Stone Age Europe hunted, fished, and gathered fruit and nuts.
