

Stone Age animals

Many Stone Age animals would be terrifying to humans today! Herbivores (plant-eating animals) tended to be much larger than their modern relatives, which meant that many of the carnivores (meat-eating animals) hunting them were much larger as well. Large Stone Age animals are known as megafauna.

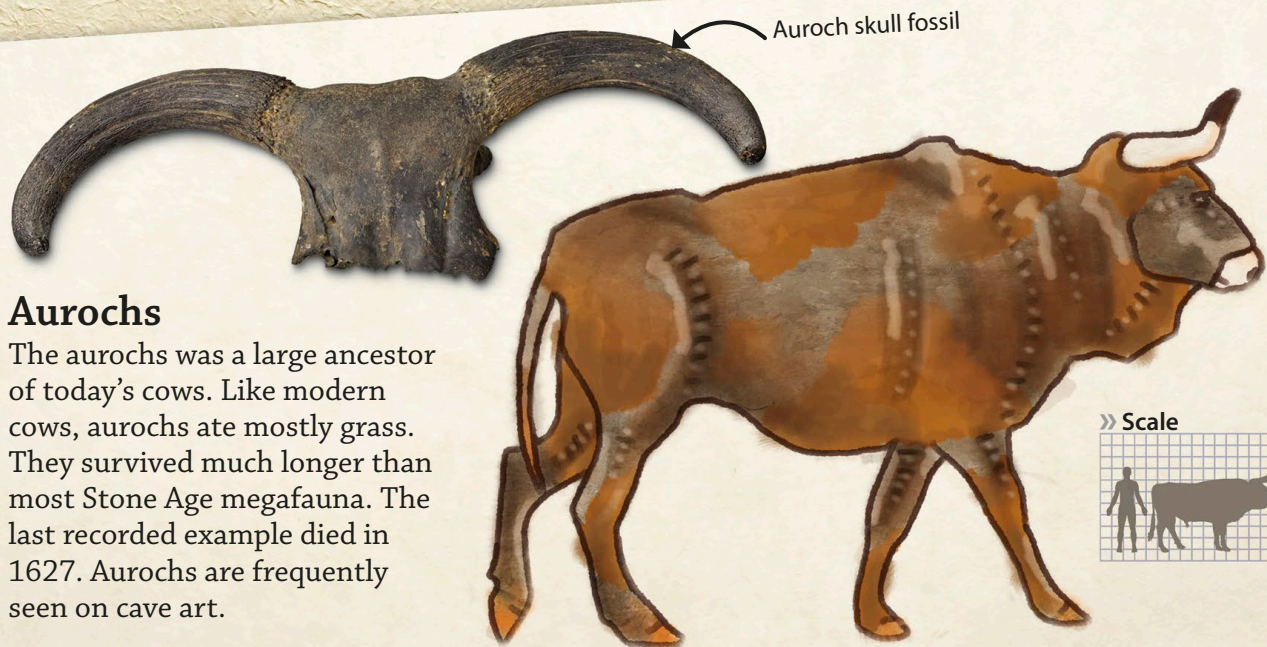

» Scale

Saber-toothed cats

These large cats had long fangs that looked like a saber (sword) and could be up to 20 in (50 cm) long! Their sharp teeth could even pierce the hair and hide of larger animals. The most famous species was the saber-toothed tiger, found only in the Americas.

Auroch skull fossil

Aurochs

The aurochs was a large ancestor of today's cows. Like modern cows, aurochs ate mostly grass. They survived much longer than most Stone Age megafauna. The last recorded example died in 1627. Aurochs are frequently seen on cave art.
