

Royal Tank Regiment badge

A tank could serve with a number of Regiments in its service life. The Royal Tank Regiment were the successors to the Tank Corps of World War I.

Night fighting

The Mark 13 can be distinguished by the large spotlight attached to the turret. This could provide conventional white light or an infrared beam for night fighting. It was adopted as a result of British experience in Korea, and that of the Americans and Australians in Vietnam. Infrared filters were also installed for night driving and these can be seen here as the outermost headlights each side, on the front of the tank.
