

the XPS 14 can easily handle all of your demanding creative tasks, and even a bit of light gaming.

In the PC Mark 10 Full SSD test, the laptop scored 2155 points which is once again way ahead of competition.

Coming to Geekbench scores, the XPS 14 scored 2850 in single core test and 16148 in multi-core test. And in Cinebench r23 benchmark, the laptop scored 13894 in multi core test and 2051 in single core test.

In real world usage, the laptop performed admirably. App launches were fast and smooth, there were no slowdowns and I could get through all my tasks easily.

Another thing that took me by surprise was the speaker setup. Because in many Windows laptops the speakers are usually just... there. But that's not the case here. The speakers of the XPS 14 are actually pretty good.

They get loud, there is proper bass, and the sound feels full. I played the official video of Michael Jackson's Beat

It in the office and the moment the music started playing, I immediately started getting side-eyes from my colleagues and had to turn the volume down. I could also clearly hear not just the music, but also the thuds and other tiny details that come with the music.

The webcam is another win here. Video calls looked sharp and clear, and most importantly, I actually looked decent during meetings. So, both the speakers and webcam are far better than what I have seen on several other laptops in this price range. Kudos to Dell for that.

BATTERY AND THERMALS

Now nobody likes laptops that make you hunt for a charger on a busy work day. And the XPS is NOT one of those devices. In our battery test, the laptop lasted around 17 hours at 70 percent screen brightness, which is quite impressive in its own right. This also means that you won't need to charge your laptop every day.

As far as real-world usage is concerned, I used the laptop comfortably through a work day full of video meetings, web browsing, and an occasional YouTube video streaming. And when it was time for me to clock out, the laptop still had 40% of battery left which is super. For added context, I was using the laptop in balanced power consumption mode at 80% brightness.

Coming to the thermals, they are also very well managed. Even while running benchmarks, the laptop's keyboard area got slightly warm but never uncomfortable to use. The touchpad and chassis remained cool overall. During our internal testing, I noticed the surface temps staying below 30 degrees in all major areas. So, the laptop can handle cooling well.

VERDICT

The Dell XPS 14 feels like a laptop that focuses on refining every little experience. It looks premium, comes with a solid build, and delivers incredible performance. The speakers and the webcam here are nice little bonuses to have. With that being said, I do wish Dell had included more ports and the touchscreen isn't of much use.

As mentioned already, this model costs Rs 2,57,890. And this is just out of reach for a lot of people. So, the Dell XPS is certainly not for everyone out there. But if you do have the budget for it, this is one of those laptops you can buy without overthinking too much.
