Imaging: Nikhil Wahal

When Digit launched in 2001, the world hadn't witnessed 3G yet, dial-up internet was a privilege in India, and a one-megapixel camera was a feature worth putting on a phone's box. Twenty-five years later, the conversation has moved so far that even the people building the technology hesitate to predict where it goes next.

So we asked them anyway. Twenty-five of India's most consequential technology leaders – CEOs, founders, country heads, engineers – answered three questions on the occasion of this magazine's

25th anniversary. Their answers form the cover story you're reading. Two themes recur across most of them: technology dissolving into the fabric of daily life, and India moving from technology adoption to technology authorship. Others speak of security, sustainability, and the limits of forecasting itself.

We didn't smooth the disagreements. They are the point. Twenty-five years in, the most interesting thing about Indian technology is that the people building it no longer agree on where it's going. And that's exciting to say the least!
