

India's Three-Step Tech Climb

VINAY SINHA | Managing Director, Sales, AMD India

AMD's Vinay Sinha lays out the clearest version of the India-as-architect argument in this package — a three-step climb from technology adoption, to creation, to standard-setting. His view of the next 25 years matches the rest of the silicon industry in one sense and parts company in another: AI gets more capable, yes, but it also gets quieter, slipping into the background of how we actually live.

How has tech evolved over the past 25 years, and Digit's role in shaping tech media in India?

Over the past 25 years, we have moved from dial-up internet to an era shaped by AI, cloud computing, and intelligent devices that are becoming more personal, responsive and connected. Through this journey, Digit has played an important role in India's technology ecosystem. At a time when hardware reviews, benchmarking and consumer tech education were still evolving, Digit helped readers look beyond specifications and understand how technology actually performs in the real world. For an entire generation of enthusiasts, it became a trusted entry point into PCs, processors, graphics and emerging technologies. That consistency and credibility is what has helped Digit remain relevant

across multiple generations of technology change.

How is tech going to transform our lives in the next 25 years?

The next 25 years will be shaped by technology becoming far more intuitive, intelligent and deeply integrated into everyday life. The shift ahead is not just about faster devices or more powerful infrastructure, but about technology becoming more capable, adaptive and context aware in real time.

AI will increasingly move into the background and become part of how we work, learn, create, communicate and make decisions every day. The next phase of technology will feel less like using software and more like

interacting with intelligence woven naturally into experiences around us.

At the same time, advances in high performance computing, AI and energy efficient infrastructure will continue to drive breakthroughs across healthcare, science, mobility, manufacturing and climate research. For India, the bigger opportunity will be the transition from technology adoption to technology creation and eventually technology standard setting. With its developer ecosystem, startup momentum and digital scale, India is well positioned to help shape the future of global technology.

Message to Digit on completing 25 years

I must say 25 years in technology media is a significant milestone, especially in an industry where the conversation can change in days, not years. What makes this achievement stand out is the consistency behind it through credible reviews, rigorous testing and honest storytelling across multiple generations of technology evolution.

Digit has not just documented India's tech journey, but has helped shape how an entire generation understands and engages with technology. Congratulations to the entire Digit team on completing 25 years, and here's to the next chapter ahead. **d**
