

From Utility To Experience

NS SATISH | CEO, Haier Appliances India

NS Satish runs Haier's India business in a category that has quietly undergone one of the most complete reinventions of the past 25 years – from utility products you bought once and forgot, to connected ecosystems that negotiate with each other in the background. His view of the next 25 years places sustainability at the centre of the conversation, arguing that innovation will increasingly be judged not by what a product does, but by what it costs the planet to do it.

How has tech evolved over the past 25 years, and Digit's role?

Over the past 25 years, technology has evolved from being largely utility-led to becoming deeply experience-driven. In the home appliances space, this transformation is evident in the shift from basic functionality to intelligent, connected ecosystems. Today, products such as refrigerators, air conditioners, and washing machines are powered by IoT, AI-driven optimisation, and energy-efficient inverter technologies that adapt to user behaviour and evolving lifestyle needs. Technology adoption has also expanded significantly across India, with consumers placing increasing emphasis on quality, performance, and long-term value.

Equally important has been the role of credible tech media platforms such as Digit in shaping consumer awareness and technology adoption. By standardising hardware reviews and introducing rigorous product

testing frameworks, the tech media ecosystem has helped simplify complex technologies into clear, comparable insights.

How is tech going to transform our lives in the next 25 years?

The next 25 years will see technology become far more intuitive, connected, and deeply integrated into everyday life. In homes, appliances will move beyond automation to true intelligent ecosystems that communicate seamlessly with each other to optimize convenience, energy usage, and overall living experiences with minimal manual intervention.

Advancements in AI, IoT, and edge computing will enable real-time decision-making within devices, improving efficiency, personalisation and performance while significantly reducing energy consumption. Manufacturing will also undergo a major transformation, with smart factories

increasingly leveraging automation, advanced analytics, and predictive systems to drive higher precision, agility, and scale

Sustainability will play a defining role in the next phase of technological evolution. From energy-efficient products to circular resource usage and renewable energy integration, innovation will increasingly be measured not just by performance, but by long-term environmental impact. At the same time, deeper digital connectivity across urban and emerging markets will make intelligent living more accessible and inclusive for a much wider population.

Any message to Digit on completing 25 years?

Congratulations to the entire team at Digit on completing 25 years, a remarkable milestone in a category that has continuously evolved alongside technology itself. Over the years, Digit has played a pivotal role in strengthening credibility and transparency within the tech ecosystem by setting benchmarks in product reviews and testing standards.

As the industry moves towards integrated ecosystems and intelligent living, the role of trusted platforms like Digit will become even more critical. Wishing the team continued success as they remain a key voice in guiding consumers through the next phase of technological evolution. 

Innovation will increasingly be measured not just by performance, but by long-term environmental impact"
