

From Photographs To Human Tissue

IPSITA DASGUPTA | SVP & MD, India, Bangladesh and Sri Lanka, HP Inc

Ipsita Dasgupta of HP doesn't take the bait on the AI-and-quantum future. The real question for the next 25 years, she argues, isn't what technology can do – it's who gets to use it, who gets left behind, and who decides. A characteristically sharp argument for democratisation over dazzle.

How has technology evolved over the past 25 years?

Twenty-five years ago, we marvelled at the magic of printing a photograph. Today, we print human tissue. That arc tells you everything about what technology has really been doing over the past 25 years: it is rewriting the boundaries of possibility and has evolved from being largely about connectivity to becoming deeply embedded in the way we work, learn, create, and solve problems. What has been particularly remarkable in India is not just the pace of technology adoption, but the way consumers and businesses have embraced it at scale.

It is the way technology is now being contextualized through meaningful use cases that impact everyday life. In education, digital platforms have significantly expanded access to learning beyond the classroom. As of March 2026, the national digital learning platform has delivered 5.66

billion learning sessions, reflecting how deeply digital infrastructure is now integrated into learning and skill development at scale. In healthcare as well, the shift has been transformative, with India's national tel-emedicine system enabling over 430 million, improving access to doctors and healthcare services, particularly in remote and underserved regions.

How is tech going to transform our lives over the next 25 years?

Everyone will tell you the future is about AI, quantum computing, and spatial interfaces. But that's the hardware of the future, not its soul.

What technology will really transform over the next 25 years is conse-

The next 25 years won't be remembered for the models we built. They'll be remembered for the barriers we dismantled."

quence: who gets included, who gets left behind, and who decides. For the first time in history, a first-generation entrepreneur from a small town has access to the same AI tools as anyone else participating in the global economy. India is uniquely positioned to define what an equitable technology future looks like.

At HP, we believe the most meaningful shift will be democratization: when intelligence runs locally on devices, more people can participate with speed, privacy, and reliability. Our responsibility as an industry is to make productive computing more accessible, more secure by design, and more useful in real contexts.

Any message to Digit on completing 25 years?

Congratulations to Digit on completing 25 incredible years.

In an era where technology is changing rapidly, consumer behaviour shifts overnight and learning and unlearning are happening faster than ever before — platforms like Digit are becoming increasingly important. As we step into a future where AI will reshape everything from classrooms to companies, we will need voices like Digit more than ever to bring the right perspectives to people and keep the industry informed, aware, and honest. Wishing the entire Digit team many more years of impact and innovation ahead.
