

# Era Of Democratised Intelligence

**SANTHOSH VISWANATHAN** | Vice President and Managing Director, Intel APJ

Over the last 25 years, India has undergone a remarkable transformation – shifting from merely participating in global technology trends to actively shaping its own digital destiny. This journey has been fueled by not just smartphones in our hands, real-time payment systems, and cutting-edge technology services, but also by the underlying computing power that drives each innovation we celebrate today. I've been fortunate to witness this transformation up close - from a society struggling with connectivity to an intensely digital ecosystem, the path has not always been smooth but resilient and innovative.

In the 2000s, technology was primarily centered around access – technology-enabled devices, con-

nectivity, and opportunities provided via a thriving IT services sector. The key here was scale, and India succeeded beyond anyone's expectations, to become one of the world's most digitally connected nations powered by affordable data and computing innovation.

This ecosystem set the stage for the transformation that followed. Technology was increasingly becoming omnipresent, changing our lives in almost every way possible - from the classroom to the boardroom, governance to grass-root innovation. This shift was driven by robust, often unseen ecosystems working behind the scenes.

At Intel, we've always believed in being your growth engine, inside – the force that enables others to do

more. As I often say, we are the "Intel Inside" that makes the Amazing India Outside. Over the years, India has not just adopted technology, we have made it work for us by building digitization at scale and benefiting society at large.

What's happened in the last decade is very much an inflection point. We're not merely using technology anymore – we're shaping it. The focus today is on design, IP and innovation, whether in electronics manufacturing, semiconductors and building Frugal AI that works for us.

Equally important has been how people have embraced technology. Platforms like Digit have played a key role in making tech accessible and relevant, helping drive real impact.

Looking ahead, the next 25 years will be the era of democratized intelligence. AI will move closer to users - personal, contextual, and embedded in devices. But AI cannot be a one-size-fits-all model. India's diversity demands solutions that are inclusive and locally relevant.

The opportunity lies in the same magic, making AI work for us by localizing, scaling, and innovating to aid our growth ahead. While challenges remain, particularly around infrastructure, supply chains and capabilities, India is well positioned to lead. And at Intel, we are excited to be "Inside" the next 25 years, enriching the lives of everyone around us! 

**We are  
the 'Intel Inside'  
that makes the  
Amazing India  
Outside**
