

From Hardware To Defiance

SUNIL RAINA | MD, Lava International Ltd

Lava is one of the few Indian phone brands to outlive the import wave, and Sunil Raina has been there through every twist. He argues the next 25 years will break the rule that has governed tech progress for half a century, powered by AI and quantum, with India positioned not as a participant but as an architect. For a brand that has spent its life proving Indian phones can compete on their own terms, that argument carries the weight of lived experience rather than aspiration.

How has tech evolved over the past 25 years, and Digit's role in that time?

Over the last 25 years, technology

has evolved manifold. We have moved from an era defined by hardware to one where software drives the experience. In that shift, consumer use cases have transformed beyond recognition. What our devices enable today was simply unimaginable 25 years ago.

The mobile phone tells this story best. From landlines to a world where smartphones are intertwined to every aspect of life - the leap in speed, intelligence and capability has been extraordinary. We have come a very long way.

With every phase, Digit has incredibly worked on credibility, contributing immensely to the tech ecosystem in India.

How is tech going to transform our lives in the next 25 years?

If the last 25 years were remarkable, the next 25 will be phenomenal. The defining shift will be the defiance of Moore's Law - the principle that has governed technology progress for decades.

What is coming, driven by AI and advances in quantum physics and quantum mechanics, will move at a pace that will be faster, smarter and better. The change will be exponentially more rapid, more powerful and more intelligent than anything we have witnessed before.

The world is going to look completely different. At Lava, that is the future we are building towards, ensuring India is not just a participant in this transformation, but one of its architects.

Any message to Digit on completing 25 years?

Twenty-five years is a remarkable milestone, and I congratulate the whole team on this incredible achievement.

As an integral part of India's technology community, Digit has built enduring credibility, not just in how it reports on technology, but in the knowledge it has created for consumers and the industry alike over the years. Many have benefited from that contribution, and its value only grows with time. **d**
