

Tech That Truly Knows You Better

SANJAY CHITKARA | Director & Co-Chief Sales & Marketing Officer, LG India

Sanjay Chitkara has watched the Indian living room change shape – from the colour TV as a generational purchase to appliances that quietly negotiate with each other. The LG India sales and marketing chief argues the next 25 years aren't about devices getting smarter; they're about devices getting attentive. And he points out how India's young demographic, and AI-enabled appliances together put India in a strong position.

How has tech evolved over the past 25 years, and Digit's role?

When I think back to the early 2000's, the conversation around technology in Indian homes was very different. A colour television was a big purchase for the family. A mobile phone was still a privilege. And the internet? That was something you experienced at a cybercafé, not in your pocket.

Twenty-five years later, technology has become deeply personal. It sits in your living room, your kitchen, your palm. It manages your energy, your health, your comfort. What changed wasn't just the products, it was how Indian consumers relate to tech.

And honestly, Digit deserves real credit for that shift. At a time when most consumers had no reliable way to evaluate what they were buying, Digit stepped in as a trusted navigator. Their reviews weren't just informative, they were rigorous,

independent, and respected. They set the benchmark for how hardware is reviewed and tested in India. That kind of credibility takes years to build. They built it early, and they've protected it ever since.

How is tech going to transform our lives in the next 25 years?

The next 25 years will be defined by one thing, technology that truly understands you. Not just responds to you but anticipates you. AI in home appliances is not a marketing gimmick, it is delivering real, tangible benefits to consumers today. Your AC learns your cooling preferences. Your washing machine that recommends the right wash cycle. Your refrigerator that helps manage your groceries. This is just the beginning.

What excites me most is what this means for Indian consumers specifi-

cally. We have a population that is young, aspirational, and increasingly connected. The convergence of AI, affordable premium technology, and India's own digital infrastructure like UPI, which the world now looks to put us in a uniquely powerful position.

The next 25 years won't just be about smarter devices. They'll be about smarter, better lives.

A message to Digit on completing 25 years

Twenty-five years is a remarkable milestone but what makes it truly meaningful is how Digit has spent those 25 years. In an industry where noise is easy and trust is hard, Digit consistently chose trust. They chose depth over clicks, honest reviews over easy relationships, and the consumer's interest above all else. That is not easy to sustain for a year. Sustaining it for 25 years is exceptional.

From LG's side, we've always believed that an informed consumer is the best consumer. When Digit tests a product rigorously and calls it out for what it is, that builds a healthier market for everyone, including us. That kind of independent voice matters enormously.

So, to the entire Digit team, thank you. Thank you for 25 years of keeping the Indian tech consumer at the centre of everything you do. Here's to the next 25. We're looking forward to it. 

The next 25 years won't just be about smarter devices. They'll be about smarter, better lives."
