

Next Global Playbook From India

AMIT KHATRI | Co-founder, Noise

Noise is the rare Indian consumer-tech brand built entirely in the smartphone era – no legacy, no inheritance, just a read of where Indian consumers were going. Amit Khatri co-founded it in 2014, and his view of the next 25 years comes from the wearables end of the ambient-computing shift.

How has tech evolved over the past 25 years, with Digit?

Over the past 25 years, technology in India has moved from being aspirational to deeply personal and accessible. Earlier, tech ownership was limited to a small segment of consumers who could understand the jargon and afford premium devices. Today, India is one of the world's most informed and value-conscious technology markets, with consumers actively shaping global product trends rather than just consuming them.

Publications like Digit played a foundational role in that shift. Digit simplified technology for everyday users, translating specs into real-world utility and creating a culture of informed decision-making. Its hardware-first testing approach helped Indian consumers.

How is tech going to transform our lives in the next 25 years?

The next 25 years will fundamentally shift technology from being device-

centric to intelligence-centric. We are moving toward an era where technology becomes contextual, predictive, and deeply integrated into everyday life. Wearables, AI, connected health ecosystems, and ambient computing will evolve from tracking data to delivering meaningful, real-time insights that improve decision-making and quality of life.

At Noise, we already see this transition beginning. The future of wearables is about understanding context, why your energy levels fluctuate, how your routines impact recovery, or when intervention is needed before a problem escalates. Hyper-personalisation powered by AI will define the next decade.

What makes this especially exciting is India's role in shaping that future. Indian consumers demand premium experiences at accessible price points, and that pressure is driving a new

model of innovation, one built on scale, efficiency, and real-world utility. The next global technology playbook will increasingly be written from India, not imported into it.

Any message to Digit on completing 25 years?

Completing 25 years in technology media is an extraordinary milestone, especially in an industry that constantly reinvents itself. Digit has not just reported on India's technology journey, it has actively shaped it. Over the years, Digit built credibility by staying rooted in rigorous product testing, honest reviews, and consumer-first journalism. In many ways, it created a generation of more informed Indian consumers who learned to ask better questions before making technology purchases. That has had a direct impact on how brands innovate, compete, and improve products.

For companies like Noise, platforms like Digit helped establish trust in emerging categories like wearables and smart audio, especially during the early adoption years. Its consistency in holding products to real standards has elevated the entire ecosystem.

Congratulations to the entire Digit team on building one of India's most enduring and influential technology platforms. Here's to the next 25 years of shaping how India experiences technology. 

The next 25 years will fundamentally shift technology from being device-centric to intelligence-centric
