

Vivo X300 FE

Fan of this edition but...

There was a time when taking good photos meant carrying a DSLR camera and spending time editing before anything made it to social media. In 2026, that gap has narrowed quickly, and brands like Vivo deserve credit for that. Over the past few years, specifically with its imaging-focused approach and partnership with ZEISS, Vivo has positioned itself among the more serious players in smartphone photography. Cut short to 2026, Vivo X300 and X300 Pro, along with the new X300 Ultra, already reflect that direction, but they also sit on the higher side of the price ladder. That naturally leaves a gap, a space for something more accessible without letting go of that flagship camera DNA. And that is where the company brought in the Vivo X200 FE in July last year, which quickly became an instant hit.

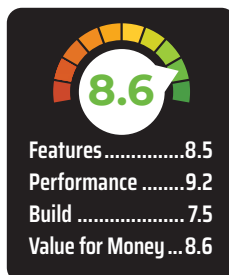

At the time, the X200 FE felt like a smart move, bringing a capable camera setup, a fresh design and balanced experience close to the Rs 50,000 price point. The phone was praised not just for its specs but for making the Vivo imaging experience reachable to the wider audience.

DISPLAY

The Vivo X300 FE comes with a 6.31-inch LTPO AMOLED display, and on paper, it ticks most of the right boxes. You get a sharp 1.5K resolution (2640 × 1216) with a pixel density of 460 PPI, a 120Hz refresh rate and support for HDR10+ along with Netflix HDR certification.

In our testing, the Calman test using Spectral C6, the display delivered an average deltaE of 0.9, which

₹79,999

is excellent. To put that into perspective, anything below 1 is considered almost indistinguishable from real-life colour accuracy. Even the maximum deltaE of 2.6 (on white) stays within acceptable limits, meaning most users will not notice any inconsistency. Colours look natural, not exaggerated, which is something you begin to appreciate over time.

The panel also covers 99.7 per cent of the sRGB colour space, so whether you are watching videos, editing photos or just scrolling through apps, colours appear as they are meant to. The white point is very close to the industry-standard D65, which ensures that whites do not look overly warm or cool; they just look right.

Peak Brightness, officially rated at 5,000 nits, is good enough for both indoor and outdoor usage. In real-world use, visibility remains comfortable in

most lighting conditions. Blacks, as expected from an AMOLED panel, are deep and inky, which helps with contrast and overall visual depth.

PERFORMANCE

For a change, Vivo has offered an FE model with a top-tier Qualcomm chip and not a MediaTek one. The X300 FE features the latest Snapdragon 8 Gen 5, and I am still a little confused about why they went ahead with this SoC. For those unaware, the 8 Gen 5 processor gets a custom Oryon-based architecture with a 2+6 all big-core design, paired with LPDDR5X Ultra RAM and UFS 4.1 storage. Just to make it simple, this hardware setup is not just designed for power but also for smarter resource allocation depending on what you are doing: gaming, multitasking or even content creation. But again, this choice is a little expensive, and I will explain why in the verdict.

That said, in daily usage, the device did not really have anything to complain about. The Vivo X300 FE is fast, smooth and well optimised. I felt the snappiness and fluidity while doom-scrolling Instagram, switching between apps, or clicking photos on the go; everything just worked the way you'd expect from a flagship. However, thermal management can cause some trouble depending on how extensively you use this phone. Despite having a big vapour chamber cooling system, the device does get noticeably warm under load. The aluminium frame, in particular, tends to warm up quite a bit during longer sessions, which makes it slightly less comfortable to hold over time.

Coming to benchmarks, the Vivo X300 FE scores 28,21,622 on Antutu, which is strong, but not class-leading for this price segment. In Geekbench, it scored 2,767 in single-core and 8,750 in multi-core. GPU performance, measured via 3DMark Wildlife Extreme, came in at 2,695, while Solar Bay scored 7,120. PCMark Work 3.0 returned a score of
