

Durability is another area where Motorola seems to be making a statement. The Razr Fold comes with Gorilla Glass Ceramic protection and IP48/IP49 ratings. Add to that the titanium-reinforced hinge, and it's a combination that flagsships at a higher price offer.

PERFORMANCE

Performance is one area where the Motorola Razr Fold becomes interesting, specifically because Motorola has made an unexpected choice here. At a time when many ultra-premium flagship phones will move towards the Snapdragon 8 Elite Gen 5 tier, Motorola has instead gone with the Snapdragon 8 Gen 5 on the Razr Fold. For a foldable in this segment, that feels both practical and a little daring at the same time.

On paper, though, this is still a very serious flagship chipset. Built on a 3nm process, the Snapdragon 8 Gen 5 uses Qualcomm's custom Oryon cores and is heavily focused on AI workloads along with raw efficiency. Pair that with LPDDR5X RAM, UFS 4.1 storage and a massive vapour chamber cooling setup, and the hardware package immediately sounds flagship-grade.

In day-to-day usage, the Razr Fold rarely gives you a reason to complain. And honestly, that matters more on a foldable than raw benchmark numbers alone. A foldable is not just about opening apps quickly; it is about handling multiple things together without slowing down. That is where the Razr Fold performs well.

I used the device extensively for multitasking. Answering work emails while streaming content on the larger inner display, switching between Chrome tabs, scrolling social media, replying to messages and running apps side-by-side never felt problematic. The larger display naturally enhances the experience, but the processor also keeps things smooth enough that you actually end up using those multitasking features regularly instead of treating them as gimmicks.

Gaming performance is also surprisingly solid. BGMI and Call of

Duty Mobile both run smoothly, with stable frame delivery and responsive touch input. Thermals, however, are worth talking about because foldables traditionally struggle here due to their thinner internal structure. The Razr Fold uses a 6002mm 3D vapour chamber along with liquid metal vapour cooling and a breathable copper mesh design, which sounds aggressive on paper. In actual use, it does help keep temperatures in control, but heating is there (under heavy load).

The benchmark numbers also support the overall experience. The device scores close to 2.9 million on Antutu, which comfortably places it in flagship territory. Geekbench 6 scores came in at 2,576 for single-core and 8,606 for multi-core performance, showing strong CPU capabilities. GPU performance is impressive, with a 3DMark Wildlife Extreme score of 5,094. PCMark Work 3.0 delivered 19,660, indicating excellent productivity, while storage speeds remain extremely fast thanks to UFS 4.1.

Interestingly, in synthetic benchmarks, the Razr Fold even manages to outperform one of its biggest competitors, the Samsung Galaxy Z Fold7, across several of the tests.

BATTERY

The device packs a 6,000mAh Silicon-Carbon battery, which Motorola claims is the biggest battery currently available in a foldable smartphone. During our PCMark Battery Life test, the Razr Fold lasted for 1,135 minutes, which is a very strong result for a foldable. In real-world usage, this translates to lasting an entire day, even with heavier usage patterns. I used the phone for multitasking, streaming content on the inner display, gaming sessions, social media, camera and work-related tasks and battery anxiety never became an issue.

Charging speeds are equally impressive. The device supports 80W Turbo-Power wired charging, which keeps refill times relatively quick despite the large battery size. Motorola has also included 50W wireless charging, which is still relatively rare in the foldable segment and makes the overall experience feel more premium and complete.

VERDICT

The Motorola Razr Fold, for me, is an important device for Motorola, not just because of the book-style foldable category, but because it attempts to make the segment feel more approachable. And to a large extent, it succeeds. It has a premium design, slim form factor, bright display, strong multitasking, dependable battery and a decent camera.

—Ashish Singh

SPECIFICATIONS

Processor: Snapdragon 8 Gen 5 Mobile Platform | Memory: 12/16 GB LPDDR5X | Storage: 256/512 GB UFS 4.1 | Main display: 8.1-inch LTPO pOLED internal display | Cover display: 6.56" LTPO pOLED display | Refresh rate: 120Hz and 165 Hz | Security: Side fingerprint sensor and Face unlock | Battery: 6000 mAh | Charging: 80 W Wired + 50W Wireless + 5W Reverse | IP Rating: IP46, IP48, IP49
