

model is 3-star rated, but it costs about 30% cheaper than its rivals. Also, on the other hand, the minimum cooling capacity of the Hisense AC is 1,785 W, which is higher than the competition's 1,500 W. This means that at its most relaxed setting, the Hisense is working a little harder than competitors.

Its air throw is rated at up to 12 metres, though I agree that matters less in a 130 sq ft bedroom. In my testing, a temperature gun reading on the wall showed a 3-degree drop in about 15 minutes. Granted, wall temperature varies with material, insulation, and airflow.

You can change fan speeds in 4 steps, depending on your need: one auto mode and three different speed levels.

Then, there is the I-Feel mode, which reads the ambient temperature at the remote's location and adjusts cooling accordingly. If you are someone who keeps the remote on your bedside table, this is genuinely useful. The unit directs cooling to where you specifically are.

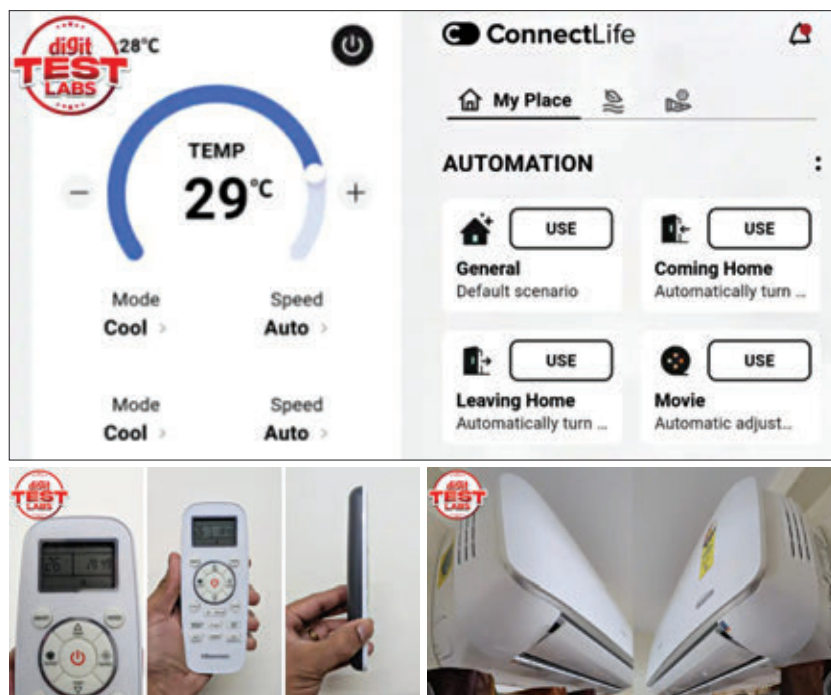

The Hisense AC is also a 5-in-1 convertible, meaning you can choose from usage-based preset modes that adjust cooling behaviour and power use:

- Baby mode for gentler airflow
- Comfort mode for balanced cooling
- Work from home mode for steady cooling with lower noise
- Family mode for faster cooling when more people are in the room
- Smart mode uses AI to adjust cooling based on ambient conditions

The brand does not specify the exact cooling capacity levels for each mode.

What the brand has explicitly displayed on the AC is the 3-star BEE rating sticker. This sticker shows the rating is valid between 1 January 2026 and 31 December 2027. The AC has an ISEER of 4.4, which denotes a sensible efficiency for the price.

Cooling aside, you also get health benefits from a 4-in-1 filter setup: a Cat-echin filter with antibacterial properties, an activated carbon layer for odour absorption, and a HEPA layer for PM2.5 particles. This is a plus if you don't have an air purifier or don't want to run one.

Hisense has also included a self-frost clean function that helps prevent mould and associated odour buildup over time. Again, a thoughtful addition.

In everyday use, the AC stays fairly quiet. My mother even asked if it was running properly, as our older AC is noticeably louder. Turn on Sleep Mode for an even hushed experience. Hisense rates the Intelli Cool Pro between 31 dB and 44 dB. In my testing with a sound level meter, noise levels ranged between 40 dB and 60 dB. This difference is expected, as brand ratings are usually measured in controlled conditions.

On the smart side, as already mentioned, the AC can be controlled through the ConnectLife app. Besides remote controls, you also get useful functions like timer, scheduling, and self-diagnosis of the AC's condition. These work reliably. There are If-Then-based automation routines, but some of the triggers were greyed out. There is no Apple HomeKit or Matter support. You can enable tariff settings in the app, which calculates your AC electricity cost based on your per-unit electricity rate. For example, you can set Rs 8 per kWh as the fixed per-unit electricity

price. But I don't understand what it does afterwards. The app does not offer detailed energy analytics.

Should you buy this AC?

The Hisense Intelli Cool Pro cools fast, stays quiet enough that my mother thought it was not even running, and has different modes and features to enrich the experience. The design is minimal, the remote is functional, the 5-in-1 convertible modes give you flexibility depending on who is in the room and what you are doing, the Super mode pulls the room temperature down when you need it, and the 4-in-1 filter with HEPA is a genuine bonus at this price.

The ConnectLife app works, and I used it more often than the remote, but some aspects like the tariff setting, the voice assistant and the automation triggers need some polishing. But these aren't in any way a dealbreaker in everyday use. And unless you are building a connected home, the absence of standards like Matter wouldn't bother you. **d**
