

LOGITECH G PRO X2 SUPERSTRIKE

Innovation comes at a price

By Divyanshi "Freaky_Duck" Sharma

For the longest time, I was a controller-only gamer (love my PlayStation 5 way too much) and wasn't very keen on trying a mouse and a keyboard. In fact, I have played most of the titles in my Steam library with a controller connected to my PC. But then, I am also a journalist, and there are times when I quickly hop into a game before getting back to writing a review or a feature. And this is where a good gaming mouse comes into the picture. Now over time, I have realised that lightweight gaming mice work best for me. And this is not just for gaming, but also for everyday work. Logitech's latest, the G Pro X2 Superstrike, fits right into that space. It is one of those rare mice that feels like it belongs both on a work desk and a gaming setup.

However, this is not just another lightweight mouse. Logitech is trying something very different here. It is rethinking something as basic as a mouse click. Yes, you read that right. Because instead of using traditional switches, this mouse uses haptic feedback and sensors to decide when a click should register. And how that

haptic feedback behaves is completely up to you. Now in theory, this could mean a better performance in your favourite games. Strong focus on the words 'in theory.' And of course, all of this comes at a premium price. The mouse is listed at 19,999 on Amazon at the time of writing this review.

SPECS AT A GLANCE

Before we delve into the details, let's look at what the Logitech G Pro X2 Superstrike brings to the table in terms of specifications. This is a lightweight wireless gaming mouse that weighs around 61 grams, which already puts it in the competitive esports category. It is powered by Logitech's HERO 2 sensor, capable of going up to 44,000 DPI, with tracking speeds of over 888 inches per second and acceleration beyond 88G.

You get support for up to an 8,000Hz polling rate, which is about as fast as it gets right now. The mouse has five programmable buttons and onboard memory, so settings stay consistent across devices.

Finally, what steals the spotlight is the new click system. Instead of traditional mechanical switches, Logitech

is using what it calls a Haptic Inductive Trigger System. This allows you to customise actuation distance and click feedback through software.

DESIGN AND ERGONOMICS

Now, if you think that each premium mouse needs to have a distinct design, think again. Logitech hasn't really taken any big risks in terms of design here, and if you have used G Pro models earlier, you are going to feel right at home.

My gaming setup is mostly black and white, and this mouse fits right into it. The Lunar Eclipse colourway looks clean and premium without trying too hard. There is also no RGB here, which may disappoint some gamers. As for me, I prefer this minimal and clean look.

The mouse is quite light, which makes it easy to move around during long sessions. That said, this is not the lightest mouse I have used. My Xtrfy M4 Wireless still feels lighter, and that costs significantly less.

Another thing that stood out to me is the finish. The surface is very smooth, almost too smooth. And even though it looks great, it does not
