

offer the best grip, especially during intense gaming sessions. I found myself wishing for a bit more texture or resistance. You can add grip tapes, and that does help, but out of the box, it feels smooth.

Coming to the button layout, it is simple and functional. You get two main buttons, a scroll wheel, and two side buttons, all well-placed and easy to distinguish. The Logitech G Pro X2 Superstrike is designed with competitive gaming in mind, where simplicity is preferred over versatility.

NEWER HAPTIC CLICKS

Let's now talk about the feature that sets this mouse apart. Instead of traditional mechanical switches, Logitech has introduced the Haptic Inductive Trigger System with the G Pro X2 Superstrike. Basically, the mouse doesn't rely on physical clicks. Sensors detect how far you press the button, and a haptic motor gives feedback to simulate that click.

The first time I used it, it felt sort of strange. The moment I pulled the mouse out of the box and tried to feel its clicks, it felt like pressing a broken mouse. There was no feedback, as it depends on the software.

Once I configured the clicks as per my liking, things got super smooth. There are just endless options here. You can adjust how sensitive the clicks are or can make them extremely light, where even resting your finger might trigger a click. In addition to this, you can also make them heavier and more deliberate.

There are multiple levels of actuation and feedback, which means you can fine-tune the mouse exactly how you like it. You can even set different actuation points for left and right clicks. I enjoyed toying around with different settings until I finally settled on a nice balance that I preferred.

On paper, all this customisation should improve your performance. After all, less travel distance means faster clicks, right? But my experience here begs to differ.

Let me first clarify that I am not an esports gamer. I mostly play story-driven games, with occasional sessions in titles like Doom: The Dark Ages, Battlefield 6, and Helldivers 2.

So I tested this mouse across these games, and while it felt different, I cannot say my performance improved. Now this could be a skill issue. Or maybe this feature is more useful for players who are already playing at a very high level. Because realistically, a mouse can only do so much. It can make you faster, but it cannot magically turn you into an esports athlete overnight.

In a nutshell, the Haptic Inductive Trigger System is a feature aimed at competitive players. If you are someone who cares about every millisecond, you might appreciate it more than I did. That said, once you find your preferred settings, the clicks do feel good. They are different from traditional clicks, slightly softer and less sharp, but satisfying in their own way.

PERFORMANCE

Outside of gaming, the Logitech G Pro X2 Superstrike behaves exactly how you would expect a premium mouse to behave.

For tasks like writing, browsing, or working on design tools, it works perfectly fine. There is no noticeable advantage from the haptic clicks here. You should not expect to save time in your workflow just because your clicks register faster.

The HERO 2 sensor continues to be a strong aspect of this mouse. Tracking is accurate and consistent across surfaces, and there were no issues during my usage.

Talking about the battery life, it is rated at around 90 hours, and in my usage, it held up. I used it for seven hours a day for work and up to two hours for gaming, and I didn't need to charge it for a week.

One important thing to note here is that the battery performance also depends heavily on your haptic settings. Higher feedback levels consume more power, which is something you need to keep in mind. Since I mostly used moderate settings, battery life was not an issue for me.

VERDICT

The Logitech G Pro X2 Superstrike is one of the most interesting gaming mice I have used in a while. And this isn't because it looks different, but because it is trying to change something fundamental. The haptic click system feels like an innovation that comes at a premium cost. It offers a level of customisation that you simply do not get anywhere else right now. And for competitive players, this could translate into an advantage. *
