

WWDC RECAP

WWDC 2026 recap: iOS 27, macOS Golden Gate, Siri AI

At what is likely Tim Cook's final WWDC keynote as CEO before John Ternus takes over, Apple unveiled a sweeping software refresh led by a ground-up rebuild of Siri. The new Siri AI is powered by Google Gemini and Apple's own Foundation Models, but it arrives as a beta in September, in English first, and will skip the

EU and China initially. iOS 27 reaches back to the iPhone 11 and promises roughly 30% faster app launches, while macOS 27 'Golden Gate' extends the

Liquid Glass design to the desktop. Photos gains Clean Up, Extend and Reframe tools, Safari can auto-organise tabs, and Image Playground adds photorealistic generation. Together the updates mark Apple's most aggressive push yet into agentic, on-device AI.

PARENTAL CONTROLS

WWDC 2026: What new tools Apple is giving parents to manage kids' screen time

Apple used their Worldwide Developers Conference 2026 to give parents a meaningfully expanded toolkit for managing

children's device use. A new Ask to Browse feature lets kids request approval before visiting unfamiliar websites on Safari, while a redesigned Screen Time dashboard makes activity easier to read at a glance. Time Allowances let parents cap usage by app category, such as social media, gaming or entertainment, rather than app by app. Setting up a Child Account is now simpler, and Communication Safety has been upgraded to detect graphic violent content on-device. The features will be shipping later this year with iOS 27, iPadOS 27 and macOS 27.

Apple iOS 27's most powerful on-device AI comes with a limitation: Supported devices

While iOS 27 itself runs on iPhones going back to the iPhone 11, Apple's most powerful on-device AI model

carries a stricter requirement. It needs at least 12GB of unified memory, which means the standard iPhone 17 with 8GB is left out. Supported hardware includes the iPhone Air, iPhone 17 Pro and Pro Max, iPads with M4 or newer and 12GB, Macs with M3 or newer and 12GB, and the M5-based Vision Pro. The advanced model unlocks more expressive synthesized voices and significantly improved dictation.

WWDC 2026: 10+ new features coming to tvOS 27 and watchOS 27

Apple detailed a list of upgrades for tvOS 27 and watchOS 27. Apple TV gains about 30% faster app

launches, Hi-Res Lossless 24-bit/192kHz audio, a refreshed Podcasts app, Smart Downloads, 4K camera recordings and Thread 1.4 smart-home support, plus accessibility additions like Larger Text and speech-to-subtitle. The Apple Watch picks up Siri AI, a smarter Smart Stack, Live Translation in Messages and an AI Workout Buddy that coaches you during exercise. Apple Music can build playlists automatically. tinyurl.com/bdcwp6mx
