

SAFARI AI

Apple just gave Safari AI superpowers: Here is how it can make your life easier

One of WWDC 2026's biggest stories is how deeply Apple has woven AI into Safari. A new Organise Tabs feature uses Apple Intelligence to analyse open tabs and group them by topic, taming the usual sprawl of

unrelated tabs. The Notify Me tool lets Safari monitor a webpage in the background and alert you when something changes, such as a restock or a price drop, so you

stop refreshing. Most striking is Describe an Extension, which lets anyone create a browser extension just by explaining what it should do. tinyurl.com/57jkxt8f

MACOS & IPADOS

WWDC 2026: macOS 27 Golden Gate and iPadOS 27

macOS 27 Golden Gate and iPadOS 27 bring five changes, though Golden Gate drops support for Intel Macs and runs only on Apple Silicon. Siri becomes a far smarter agentic assistant that can draft emails, surface information across apps and plug into Spotlight. Apple Intelligence increasingly takes over everyday workflows, from auto-fixing weak passwords to building Shortcuts

from plain-English descriptions. Performance improves and a new transparency slider lets users adjust the Liquid Glass. tinyurl.com/yjz9fhmd

WWDC 2026: Apple's new Siri AI can do things no other AI assistant can

Unlike chatbots that live in a sand-boxed window, Apple's new Siri AI operates at the operating-system

level, giving it a reach rivals cannot yet match. Powered by Gemini and Apple's foundation models, it can read your files, Messages, Mail and Photos to act on the context of a prompt. In one demo it compared three PDFs from a right-click menu and pulled relevant details out of private correspondence to answer a follow-up question. On iOS it chained find-filter-add-share actions across Photos and built a multi-stop route by digging an address out of an old message, all from a single sentence. It launches in English only for now, with more languages expected later. tinyurl.com/mtpwhtxn

Not only Siri AI, here are the biggest Apple Intelligence features at WWDC 2026

Siri grabbed the headlines, but Apple Intelligence expanded across nearly every core app at WWDC

2026, built on new Foundation Models and Private Cloud Compute. Photos gains Spatial Reframing, an Extend tool and better Clean Up, while Image Playground adds photorealistic generation you can tweak with natural language. Safari learns to organise tabs, monitor pages and build extensions on request, and the Passwords app can now automatically replace weak credentials on supported sites. Messages, Mail and Calendar get smarter suggestions, Smart Reply and natural-language event creation, and Shortcuts can be created just by describing them. The Home app and accessibility tools round things out with activity summaries, camera-footage descriptions and richer VoiceOver. tinyurl.com/54f82dpw
