

THE AI YOU AREN'T USING YET

BEYOND THE CHATBOT, THERE'S A LOT TO DO

Team Digit | editor@digit.in

Forget asking a chatbot to write your email. The real magic of AI lives in niche tools: voice you can clone, faces you can puppet, photos you can resurrect, and so much more. Here's a field guide to AI's wild edge.

1) Clone your own voice

Record 15 seconds, and suddenly "you" can narrate an audiobook at 3am while you sleep. Your pitch, your quirks, your accent – bottled.

Tools: ElevenLabs (gold standard), Fish Audio (emotion tags, cheaper), Resemble AI (enterprise-grade, built-in deepfake detector).

How: upload a clean, noise-free sample → type a script → generate → export MP3. Add tags like [excited] or [whisper] for performance.

2) Generate a full produced song

Hum-free songwriting: type a vibe and lyrics, get back a real track with verses, a chorus, and a bridge – vocals included.

Tools: Suno and Udio (both produce complete songs); Google's Lyria lives inside Gemini's "Create music."

How: write a style prompt ("melancholic lo-fi, soft female vocal, monsoon mood") → paste lyrics → generate → regenerate the bits you dislike → export stems if you want to remix. Use ChatGPT or Claude to write tight, metered lyrics first.

3) Drive a character from your selfie video

Act out a scene in your bedroom; a wizard, robot, or cartoon performs it exactly – your head turns, your raised eyebrow, your lip-sync – no motion-capture suit.

Tools: Runway's Act-One (purpose-built for this), plus Hedra.

How: film a clean, well-lit clip of your face talking → upload it as the "driving performance" → pick or upload the character to puppet → render.

Watch out: big head turns and occlusions (hands over face, glasses glare) break the mapping. Keep movements expressive but not wild. Driving a real

person's likeness without permission is off-limits on most platforms.

4) Create an AI presenter from a script

Type a script, pick a polished human-looking avatar, and get a talking-head training video in 30 languages – no camera, no studio, no awkward on-camera takes.

Tools: Synthesia, HeyGen.

How: choose an avatar (or make one of yourself) → paste your script → select language/voice → render → swap text anytime to update.

Watch out: avatars still have a faint "presenter robot" stiffness; gestures don't always match emphasis. Great for explainers and L&D, weak for anything needing real warmth or spontaneity. Custom avatars of yourself need a consent verification step – by design.

5) Restore a damaged old photo

That cracked, faded 1950s portrait of
