

graphs. It costs nothing. The ideal starting point for mapping an unfamiliar field, spotting the seminal works and quickly grasping what a paper says before you commit to reading it in full.

<https://www.semanticscholar.org>

scite — Classifies citations as supporting, contrasting or merely mentioning a finding, drawing on 1.2 billion-plus citation statements. It runs about \$20 a month. Use it to check whether a claim actually held up in later research, instead of assuming a heavily cited paper was a heavily endorsed one.

<https://scite.ai>

SciSpace — An in-PDF copilot that explains dense passages and equations as you read, across a base of 280 million-plus papers. Freemium, with paid plans near \$9.99 a month. The tool to keep open when you are wrestling with a single difficult paper and need a patient explainer beside you.

ResearchRabbit / Connected Papers

— Two visual discovery tools that map citation networks so you can find related work by following the graph rather than guessing keywords. Both offer free tiers. Use them to surface the neighbours of a key paper — the prior work it built on and the studies that later cited it.

ANALYSE DATA BY JUST ASKING

Julius AI — Upload a CSV or Sheet, ask questions in plain

English, and get charts plus a written interpretation — it quietly writes and runs Python underneath. Free tier; Plus is \$20 a month. Perfect for conversational analysis of small-to-mid datasets without touching a line of code yourself.

<https://julius.ai>

Rows — A spreadsheet with AI and live data connections built in, so analysis happens inside a familiar grid. It blends the comfort of cells with AI assistance. Use it when you want smart help and live external data without leaving the spreadsheet paradigm you already know how to drive.

<https://rows.com>

Hex — A notebook and workspace built for collaborative, governed team analytics, mixing SQL, Python and rich reports. It is aimed at data teams who need shared, auditable work. Reach for it when analysis is a team sport and you need governance, reproducibility and polished outputs in one place.

<https://hex.tech>

Deepnote — A collaborative, AI-assisted data notebook designed for notebook-first team data science. It makes working together in a notebook feel as smooth as a shared doc. Use it when your team lives in notebooks and wants real-time collaboration plus AI help without stitching together separate tools.

<https://deepnote.com>

Powerdrill — A budget-friendly, Julius-style upload-and-chart tool that generates code-backed visualisations at a lower price. Free tier; Pro is around \$17 a month. The pick when you want

conversational, code-generated charts but would rather not pay premium rates for occasional analysis work.

BUILD AGENT AUTOMATIONS WITH NO CODE

Gumloop — A visual, no-code builder for AI-first workflows, with built-in AI nodes, MCP support and scheduled triggers. Free plan available; paid runs about \$37 a month. Use it to automate summarising, extracting and routing work — chaining AI steps together visually instead of writing brittle scripts.

<https://www.gumloop.com>

n8n — Open-source, self-hostable workflow automation with a code fallback for when the visual nodes are not enough. Free to self-host; cloud starts around \$20 a month. The choice for private, deeply customisable automation infrastructure that you fully own and can extend with your own logic.

<https://n8n.io>

Lindy — No-code AI agents for inbox triage, scheduling, sales follow-up and multi-channel messaging across email, SMS, WhatsApp and Telegram. A free tier covers roughly 40 tasks; Pro scales to around 1,500. Use it to hand routine sales and operations chores to an agent that works across your channels.

<https://www.lindy.ai>

Manus — An autonomous general agent that browses, researches and produces finished deliverables from a single
