

a shared, polished chat UI. It is free. Use it when several people need to use your local AI through a clean browser interface rather than each wrestling with the command line.

<https://openwebui.com>

LocalAI — An OpenAI drop-in API for text, image and audio that you self-host, letting you swap cloud calls for local inference. Free and open. The pick when you want to ship a product feature powered by local models while keeping the familiar OpenAI-style API your code already speaks.

<https://localai.io>

CAPTURE MEETINGS AND TRANSCRIBE AUDIO

Granola — An AI notepad that captures meetings and builds a searchable external brain across Mac, Windows and iPhone, connecting to Claude or ChatGPT via MCP. Use it to turn every meeting into notes you can query later — asking your own archive what was decided weeks after the conversation.

<https://www.granola.ai>

Fathom — Records meetings and automatically generates summaries and action items, with a useful free tier. It quietly handles the note-taking so you can stay present. Use it to get automatic, accurate recaps of calls — who said what and what needs doing — without lifting a finger during the meeting.

<https://fathom.video>

MacWhisper — Local, Whisper-based transcription for Mac that

keeps everything on-device. Because nothing is uploaded, it is private and accurate. Use it to transcribe interviews, voice notes or recordings where confidentiality matters and you would rather not send sensitive audio to a cloud service.

CREATE 3D MODELS AND SCENES

Spline — Browser-based interactive 3D design with AI generation, embeddable on any site via an iframe. The freemium plan is approachable. Use it to build web-first interactive 3D scenes and UI elements that visitors can actually click and rotate, no heavyweight 3D software required.

<https://spline.design>

Meshy — A full text- and image-to-3D pipeline with auto-rigging, 500-plus animation presets, PBR materials and smart remeshing. Freemium. The end-to-end choice for game-ready 3D assets — from a prompt to a textured, rigged, animation-ready model without bouncing between separate tools.

<https://www.meshy.ai>

Rodin (Hyper3D) — Generates hyper-realistic human characters, backed by serious research muscle. It specialises in believable virtual people. Reach for it when your project needs realistic digital humans — game characters, avatars or virtual presenters — rather than stylised or low-poly figures.

<https://hyper3d.ai>

Sloyd — Combines parametric and generative 3D with real-time slider control, so you can dial a model's proportions live. Use it when you need controllable, customisable game models you can tune precisely — adjusting dimensions on the fly instead of regenerating and hoping for a better result.

<https://www.sloyd.ai>

Hunyuan3D (Tencent) — A credible open-source 3D generator you can self-host for a local, customisable pipeline. It is free and open. The pick for studios and tinkerers who want to run 3D generation on their own infrastructure and adapt it to a bespoke workflow.

RETHINK HOW YOU SEARCH THE WEB

Comet (Perplexity) — An AI-native browser with in-page research and an autonomous Computer agent that can act on your behalf. It is free to use. Reach for it when browsing is really about producing something — research that ends in a deliverable, with an agent handling the legwork across tabs.

<https://www.perplexity.ai/comet>

Andi — A conversational, ad-free answer engine that gives clean responses without the clutter. It is a smaller, independent player, so treat it as less established than the giants. Use it when you want a calm, conversational search experience free of ads and SEO spam.
