

was the only brand that could make two devices feel like they were part of one seamless experience, Samsung and Windows, despite being two completely different entities, are doing a much better job than you might expect. And my Galaxy Book 6 Ultra, paired with the Galaxy S26 Ultra, is living proof of that.

Sure, not everything is perfect, and there are still a couple of things I genuinely miss from my Mac. For instance, the ability to natively change an image's file type, or easily resize multiple images at once using Preview. Another very convenient feature is being able to simply press the space bar to quickly preview photos and videos. And then there's the screenshot workflow. On a Mac, after taking a screenshot, before it even gets saved to its designated location, you can instantly grab the preview from the corner and drag and drop it anywhere. It's especially useful when I quickly want to drop a screenshot into ChatGPT's search box without having to dig through folders.

PANTHER LAKE PAIRED WITH RTX 5070

Now comes the actual meat of this machine, the performance. The Intel Panther Lake chipset inside this thing is an absolute beast; I have said it above, and I will say it again. I mean, there's no other way for me to put it. Everyday usage is obviously effortless, but that is expected from a premium laptop.

You see, the Intel Core Ultra 7 356H chip is a high-performance 16-core

processor that also features a 50 TOPS NPU. But beyond its AI capabilities and how fast and relevant it is going to be in the future, what genuinely impressed me, though, was just how confidently this machine handles all sorts of workloads. Of course, the aforementioned Core Ultra 7 356H CPU, RTX 5070 GPU, paired with 32GB LPDDR5X RAM and 2TB of superfast NVMe SSD storage packs quite a performance punch.

But gaming is where the combination of Panther Lake and the RTX 5070 really starts to shine. This is not a full-powered RTX 5070 implementation. Samsung has tuned the GPU to a 90W TGP, which obviously means it won't perform like the mainstream Alienwares and Razer Blades of the world; laptops that are thicker, louder, and built entirely around gaming performance. But, for what this machine is trying to achieve, the balance here is surprisingly good. Because, at the end of the day, this is still a relatively thin and premium productivity-first laptop that also happens to game properly.

For instance, I played Shadow of the Tomb Raider on this machine quite extensively, and the performance was genuinely impressive. At 1080p resolution, with high settings and DLSS enabled, the game comfortably stayed around the 110-130 fps mark, while temperatures remained surprisingly manageable. Hogwarts Legacy, which is an even heavier and far more demanding title, also ran surprisingly well. Now yes,

this is exactly the kind of game where you can tell the RTX 5070 here isn't running at its absolute maximum wattage. But even then, with the right settings tweaks, the experience remained genuinely enjoyable. At high settings with DLSS enabled, I was getting around 60-75 fps in most areas, while some of the heavier open-world sections dipped slightly lower. But I would again say that Nvidia's DLSS technology deserves a lot of credit here because it really helps maintain smoother frame rates without heavily compromising the visual quality. And because this laptop also supports frame generation, gameplay feels noticeably smoother than what numbers may suggest. Also, surprisingly, the fans aren't annoyingly aggressive either, whenever they do fire up to keep temps under control.

—Aman Rashid

SPECIFICATIONS

CPU: Intel Core Ultra 7 356H (Panther Lake, 16-core) | GPU: Nvidia GeForce RTX 5070 (90W TGP) | RAM: 32 GB LPDDR5X | Storage: 2 TB NVMe SSD | Display: 16-inch WQXGA+ Dynamic AMOLED 2X | Refresh Rate: 120 Hz | Brightness: 1,104 nits (tested) | NPU: 50 TOPS | Battery Life (PCMark): 897 minutes | Weight: 1.79 kg | OS: Windows 11 | Ports: 2x Thunderbolt 4 (USB-C), 1x USB-A 3.2, HDMI 2.1, 3.5mm jack, SD card reader | Charging: 140W (bundled)
