

HP Omnibook 5

Light as a feather, lasts like a brick

There are laptops which do not beg for your attention. No flashy design, no boasting specs, and no RGB light that will turn your desk into a night club. This is a laptop that comes each day, serves its purpose, and then goes away. That's the HP Omnibook 5 (2026) right there, and if you take some time to give it a go, chances are you will like what you see.

Costing ₹1,24,999, the Omnibook 5 aims at the business user looking for a good daily driver. This laptop should offer a decent build, a great look, and excellent battery life. To put it simply, if all three aspects are met, there will not be many people able to complain. In this particular case, all the three aspects are quite good. You cannot say anything bad about the screen on this laptop. It is just great. The battery will last forever and ever. Lastly, at 1.3 kg, this is a very lightweight machine.

In other words, if you want a reliable daily driver for your tasks, this is probably what you have been waiting for. Here is why.

DESIGN AND BUILD

Weighing just 1.3kg and only 13.6mm thick, the Omnibook 5 is easily stowed away in a shoulder bag, then forgotten entirely. The metal casing feels solid and substantial, while the matt finish deals with fingerprints as well as an adult would, and all of this packed into dimensions of 312 × 217mm – still relatively compact for a 14-inch model.

Keyboard design is neat and makes sense, with no numpad and nothing too fancy. FN key sharing for media controls and backlight adjustment is now expected at this price point, so we're not getting any sleepless nights from it. The

₹1,45,999

touchpad is sensitive and responds well. There's absolutely nothing flashy here in terms of construction – except some solid quality and precision behind it.

DISPLAY: CINEMATICALY GOOD

Let's get the numbers out of the way: 14-inch 2K OLED panel with 300 nits of brightness. By any display standard, this is a very colour accurate and beautiful display. In practice, the display is the part of this laptop you'll brag about. Playing Star Wars Jedi: Survivor on it – a game that's full of cinematic lighting – felt genuinely good. Not "good for a budget laptop" good. Just good. And watching Project Hail Mary, a film that deserves the best screen you can give it, the Omnibook 5 held its own. It's not IMAX. But you'll finish the movie satisfied.

It's a matte panel too, which means no ghostly reflections of your ceiling fan while you're trying to work. A decision HP got right. The one asterisk: 60Hz.

For productivity and content, pretty much invisible. For some light gaming, we'll get to that.

PERFORMANCE: SOLID, FOR THE MOST PART

With 16GB of LPDDR5X at 6,800MHz, the Core Ultra 7 355 is a competent everyday CPU that can get through pretty much anything a regular person would do with a thin-and-light laptop without any trouble. The 1TB NVMe SSD delivers sequential read/write speeds of 6,381 MB/s and 5,255 MB/s, respectively, on CrystalDisk, which translates into quick app launches and large file transfers. PCMark 10 gave the laptop an overall rating of 7,482, a good score for this kind of machine – productivity tasks such as writing documents or making video calls run smoothly. As for performance, Cinebench R23 returned a multithreading score of 10,067 and a single-thread result of 1,899, a decent score for a thin-and-light notebook that operates almost completely silently. Geekbench 6 gave the Intel CPU 2,734 single-core points and 11,093 multi-core points – not amazing, but still quite good. Finally, as far as AI is concerned, Procyon AI Computer Vision benchmark (Windows ML Float32) scored the onboard NPU 85 points, placing it in the realm of everyday computing power – enough for some basic noise cancellation and live captions.

One honest caveat: under sustained heavy load, the CPU peaked at 96.3°C during our Cinebench stress test, and we saw a throttle gap of around 2,859 points in back-to-back runs. In other words, it slows itself down to stay cool when you push it hard for extended periods. That's expected behaviour for a 13.6mm chassis but it's not just an internal story. Surface temps under load tell it plainly: WASD hit 35°C, the centre cluster reached 32°C, above the keyboard was 34°C, and the palm rest came in at 34°C. The bottom panel was the coolest at 29°C, which is cold com-
