

range, you'd typically expect the phone to do more than that.

In Antutu, the F33 Pro scored a modest 647,777, which is much lower when compared to other phones in the same price range. A similar pattern was seen in the Geekbench 6 tests, as it put up a single-core score of 771 and a multi-core at 1,980, which is well behind what the competition offers at this price point. In our 15-minute CPU throttle test, the chip settled at 93 per cent of peak performance, which suggests that managing sustained performance is reasonable, but yes, in the real world, the performance does start to throttle when pushed to the limits.

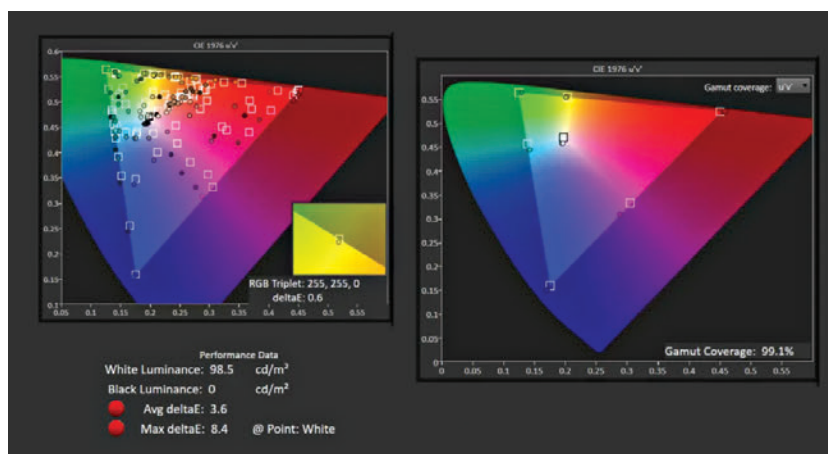

Naturally, gaming is again where the difference starts to become most apparent. I tried playing games like BGMI and Call of Duty, and on medium-to-high settings, the results weren't impressive. There were noticeable frame drops, and anyone who games seriously will find this chipset limiting. Not to forget that the UFS 2.2 storage is another tough sell in 2026, as at this price, at least, UFS 3.1 should be the standard. For a device and this price range, this is a difficult trade-off.

Thankfully, the software side of things is much better. The Oppo F33 Pro boots ColorOS 16 based on Android 16, which feels smooth and polished.

BATTERY AND CHARGING

Where performance falls short, the battery almost makes up for it, as battery life is clearly one of the highlights for the F33 Pro. The phone packs a large 7,000mAh battery paired with an 80W fast charger in the box. It's a combination that Oppo has been using on a lot of its devices recently.

In real-world usage under medium to heavy load, the phone consistently lasted 1.5 to almost 2 full days. Meanwhile, in our PCMark Work 3.0 battery test, it ran for a solid 23 hours and 22 minutes before hitting 20 per cent, which indicates a strong result. Moreover, the 80W charger allows the phone to be charged in under an hour.

OPPO F33 PRO: CAMERA

We cannot talk about an Oppo phone without talking about its camera.

First off, the 50MP front camera is arguably the best selfie camera in this price range. The natural skin tone processing makes portraits look like actual people, and the main advantage comes in the form of group selfies. They are handled with ease, as the wide field of view makes capturing large group selfies possible. I tried clicking pictures in both harsh outdoor sunlight and even low light, and the front camera balances both these experiences very well.

However, the rear camera is much different. In bright daylight, the 50MP main sensor performs well; the colours feel vivid, there's a good amount of detail, and the images feel natural. Where it struggles, however, is almost everywhere else. Yes, you read that right. The dynamic range is poor, and photos taken in low light are a clear weakness, as there's visible noise and softness. Just have a look at some of the samples yourself.

To sum it up, just know that the front camera is very good on the F33 Pro. In my books, it is actually excel-

lent. However, the experience with the rear camera, on the other hand, feels dated. Limitations like no ultra-wide, no telephoto, no OIS, and only 1080p video recording restrict the experience.

When you're spending this kind of money on a smartphone, these are some things that are not minor omissions but basic expectations.

FINAL VERDICT

For a buyer who prioritises build quality, battery, and selfies above all else, the Oppo F33 Pro is a solid pick.

—Madhav Banka

SPECIFICATIONS

SoC: MediaTek Dimensity 6360 MAX | RAM: 8 GB LPDDR4X | Storage: 128/256 GB UFS 2.2 | Display: 6.57 inch FHD+ AMOLED Panel | Refresh Rate: 120 Hz | Brightness: 1400 nits | Camera(Rear): 50 MP + 2 MP | Camera (Front): 50 MP | Battery: 7000 mAh | Charging: 80 W
