VS

OPPO FIND X9 ULTRA

VIVO X300 ULTRA

WHICH ONE IS THE BEST CAMERA PHONE OF 2026

Siddharth Malhotra | editor@digit.in

T

he Oppo Find X9 Ultra and the Vivo X300 Ultra are not just two flagship phones

competing on specs. These are two of the best phones money can buy right now, with cameras attached to them.

While one of the phones focuses heavily on detail retention, consistency and long-range zoom performance. The other leans towards cinematic processing, dramatic portraits, and feature-heavy camera tools designed to instantly create social-media ready shots. Which one is which?

So, instead of doing another predictable camera comparison in the Delhi NCR region, I packed my bags along

with both the Oppo Find X9 Ultra and Vivo X300 Ultra and travelled across Rishikesh, Dharamshala and McLeod-ganj to test them properly in real-world conditions. Bright sunlight, difficult sunsets, mountain landscapes, IPL stadium, low-light streets, portraits, zoom shots, videos, literally everything.

Primary camera

Starting with daylight photography in Rishikesh, both phones immediately took impressive photos. Not that I had any doubts. But once you start zooming in on the details, that's when you start looking at the differences clearly.

In one of the poolside images, the Oppo Find X9 Ultra retained slightly

more detail near the lower section of the pool lounge. One thing you notice is how differently both phones processed the same scene. Oppo tried to preserve more background information and detail, while Vivo instantly leaned towards a more dramatic image with stronger background blur and strong separation.

In another pool shot from a different angle, Vivo added a slightly cooler blue tint to the sky, something that remained consistent throughout the comparison. Oppo, on the other hand, retained more shadow detail and texture in darker areas around the fountain, while Vivo crushed some of those regions slightly more aggressively.
