

The differences are not massive at first glance. But the more you zoom into the images, the more you notice how Oppo consistently gives you more texture retention, while Vivo focuses more on visually punchier images that are social-media ready.

Macro Photography

While walking around the pool area, I noticed a small bug on the floor and instantly switched both phones to macro mode. And honestly, both phones performed extremely well here. But after zooming in on the wings, you can see the smaller textures that Vivo managed to capture, with slightly better micro-detail.

Portrait Mode

Portrait photography is where each phone shows its own character clearly.

While capturing human subjects, the Oppo Find X9 Ultra consistently brightens faces, and sometimes it didn't look that natural. Vivo, meanwhile, tries to preserve more natural skin tones while giving you the stronger subject separation and creamier bokeh.

In practical use, Vivo's portraits instantly look more cinematic. The background separation is stronger, the depth effect feels cleaner, and the images carry a more dramatic mood overall.

Oppo takes a different approach. It often tries to keep more of the frame in focus rather than separating the subjects. Because of that, portraits sometimes feel slightly flatter compared to Vivo, even though the Find X9 Ultra often retains more facial texture and fine details.

At 6x zoom on Oppo and 5.9x on Vivo, things become a bit close. Both phones produce extremely similar-looking portraits in terms of colours, mood, and overall blur quality.

In one of my portrait images, the difference was quite clear. Oppo blows out the highlights of my shirt and on my hand, while Vivo handles highlights in a balanced way, and overall, the photo

looks more pleasing when captured from the Vivo.

In Dharamshala, portraits became even more interesting because Vivo consistently prioritised the subject. In one particular image featuring two kids, Vivo focused on the first subject, while Oppo kept both individuals relatively sharp.

Ultra-wide Camera

Unlike how we see 'ultra-wide cameras' on phones, the lenses on these two phones are quite good. In fact, the results from both the X9 Ultra and X300 Ultra were shockingly close mostly

Using the ultra-wide sensors, both phones capture excellent detail levels, strong colours, and very usable dynamic range. In many outdoor scenes, the differences are visible when you pixel peep.

In terms of differences, Vivo once again leans towards more saturated col-

ours and heavier contrast. If you look at the picture, you can see that the foliage is greener on the Vivo, while Oppo maintained a more balanced look.

Overall, both ultra-wide cameras are undoubtedly flagship-level, but to me, Oppo occasionally felt slightly more balanced and controlled.

Telephoto and zoom performance

The Vivo X300 Ultra has superb zoom performance, but the Oppo Find X9 Ultra, with its hardware, takes the telephoto game up a notch. Within realistic zoom ranges, the Find X9 Ultra feels a little more capable as a long-range shooter overall. **A**
