

Nuuk rechargeable table fan

The gadget I did not know I needed

G. S. Vasani | editor@digit.in

Last month, a relatively new brand on the block called Nuuk reached out with a review unit of its Lit v3 rechargeable table fan. A table fan isn't a kind of product I would normally get excited about. But, this one is more of a personal fan with a unique as well as utilitarian design. It has a rechargeable battery, and so it came in handy during power cuts. But not just that, it acquired a permanent spot on my study/work table. Since it is a light fan, I would easily move it to the bedside table, dining table and beside the sofa while watching television.

The biggest surprise, however, was that I was not the only one who seemed to enjoy it. My Labrador, named Oscar, would often lie in front of the fan. And he would simply refuse to move from the spot until the fan was switched off.

So, after spending time with the Nuuk Lit v3, here's what both of us have to say. Well, his quick verdict is Bow Bow. And for my verdict of whether you should buy it now, now now, read on.

Design and build quality

The Nuuk fan dons a neo-retro design with pastel colours and matte finish. The largely ABS plastic body reminds you of a traditional table fan. Form-wise, it looks minimal, miniature and has a light and compact build. So, with that size and muted colours, it can easily blend in at home and the workspace. And it appears more like a desk accessory than a household appliance.

The matte finish means it doesn't attract smudges that easily. In my month-long use, I have used it in the kitchen, dining table, study/work space, and even placed it next to Oscar. Still,

today, when I was taking pictures of it, the fan looked just as new.

Even if dust accumulates on the blades over time, you can easily access them by removing the grille. This grille has a very narrow gap, and so, fingers wouldn't easily reach the blades, in case you are concerned about that.

Now, as already mentioned, you can easily carry it around thanks to its polycarbonate fan material coupled with a wooden stem and the carrying strap. The round base keeps the fan stable, even at the highest speed and with oscillation enabled. The oscillation movement is smooth, and the twistable hinge lets you angle the fan in different directions. The fan's head is held firmly in the angle you place it. But when it is bent aggressively to one side, the fan tends to lose balance. So, weight distribution can possibly be uneven in certain hinge positions.

Rest, on the fan, you get clicky buttons for changing speed levels and light intensity. There is no Wi-Fi or app functionality here. And I appreciate the whole neo-retro physical button-only approach that they have taken.

But you don't have to rely on these buttons for everything.

Features and everyday use

Now, before we get to the actual speed and cooling performance, we need to talk about its features. One of the reasons I enjoyed using the Nuuk Lit V3 is that it has many useful features.

This also includes the bundled remote that lets you remotely power on and off the fan, control its speed, and oscillation. It is a simple and handy tool. And a clever thing about the remote's design is how you can just fix it in front of the fan. This small detail could solve the common challenge of losing out on tiny remotes.

Then there is the integrated LED light on the fan, which comes with three mood light levels. So, it can act as a bedside lamp, or if your area has a power cut, that could be the one light source that would be helpful.
