

India uses Claude for entrepreneurship work more

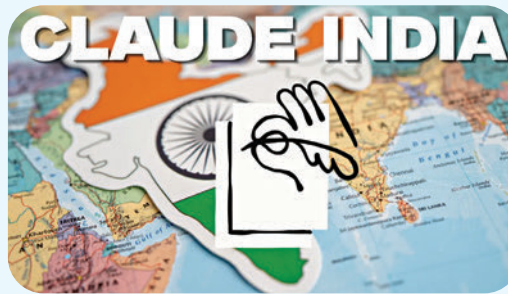

The capital, mentor and classroom millions never had

—By **Vyom Ramani**

Anthropic's biggest-ever survey of AI users – 80,508 individuals in 159 nations surveyed by an AI itself last December – has a clear data point about India: the promise of AI as a platform for entrepreneurs holds sway in Africa, South and Central Asia, the Middle East, and Latin America and the Caribbean. South Asia, which includes Indians making up the vast majority of the around 5,000 people from the region, belongs firmly to that group.

That's how Anthropic frames it: here, AI is viewed as a mechanism to sidestep traditional capital – it enables people to build their businesses without having the requisite funding, hiring, or infrastructure they might not otherwise have access to. It's quite a different story than what you'd hear in Silicon Valley, of "AI makes engineers 10x more productive." It's almost like: "AI does the work of your co-founder, your investment round, and your hiring process for you."

Globally speaking, entrepreneurship was the seventh largest aspiration when it comes to AI, with 8.7% of respondents desiring to launch and expand enterprises with AI as an amplifier, be it through product innovation to entrepreneurship conducted by oneself but at team capability level. This percentage in

South Asia is even higher, part of a general trend whereby more developed and exposed regions desire AI to help them cope with the complexities of life, and less developed regions would like AI to help them increase their opportunities.

The second India-relevant thread is learning. One could argue that it is

the more humanistic one. Learning using AI takes on greater significance in Central and South Asia, at 14% and 13%, respectively, against 8% globally. Users see education as an important means to break out of poverty traps because of scarcity of teachers, gatekeeping of knowledge, and costs involved in traditional education.

Two Indian voices picked up on that line in the report. One was an Indian lawyer who learned how to have a phobia about math because of poor performance at school, and once was afraid of Shakespeare – now studying Hamlet using an AI to translate difficult passages into easy English, and learning trigonometry without feeling "as dumb" as before. The other voice was more direct; an Indian student who said that while the professor taught 60 people and would not entertain too many questions, they could ask any question, even the "dumb" ones, at 2am. tinyurl.com/42pmhayx

OpenAI GPT 5.6 Sol reportedly deletes files without user consent, leaves them angry

OpenAI's GPT 5.6 Sol is under fire after developers claimed it deleted files and even entire production databases.

"GPT-5.6-Sol just accidentally deleted almost ALL of my Mac's files," wrote OthersideAI's Matt Shumer. OpenAI had flagged the risk, warning the model can be "overly agentic" and take destructive actions unless explicitly prohibited. tinyurl.com/mry4y9x4

Millions of users reached AI nudify sites through YouTube and X

YouTube and X drove more than 5.7 million visits to AI "nudify" websites between December 2025 and March 2026, according to the Institute for

Strategic Dialogue. The tools generate fake intimate images without consent; YouTube alone sent roughly 1.82 million referrals. Researchers say the apps remain easy to find despite platform policies that explicitly ban non-consensual sexual content, raising fresh questions about YouTube and X's rules against such tools. tinyurl.com/2ru62pyp
