

Game Menu 2.0. As a Sony TV, you also get tight integration with PlayStation 5, including automatically switching genre modes and HDR tone mapping.

AUDIO OUTPUT

The 55-inch model of the Sony Bravia 7 II has a 2.2-channel speaker setup with two side-firing full-range drivers and an Acoustic multi-audio, sound positioning tweeter. The side frames of the TV vibrate to produce sound at 40 watts.

The Bravia 7 II speakers support Dolby Atmos and DTS:X, along with 3D Surround Upscaling for virtual height effects and expanded stereo sound. The company claims the sound gets calibrated in real-time to your position, the ceiling height and the room size.

The lower bass frequency is decent but not very deep. The full-range drivers produce intelligible vocals and dialogues. If you have a compatible Sony soundbar, then you can get clearer mids, highs and deeper bass.

SOFTWARE AND REMOTE

At the time of writing this, the Bravia 7 II runs on Google TV with Android 14 and the March 2026 update. So, you get a familiar and easy-to-use UI. The navigation is largely smooth, with occasional slow loading of apps, and the cold boot time takes a sweet minute. Overall, the XR Processor does a respectable job. Not great, but not bad either.

Google TV gives you access to Google Assistant, Alexa, Google Cast, Apple AirPlay, and HomeKit. Sony has assured that in a future update, you will be getting Gemini, too.

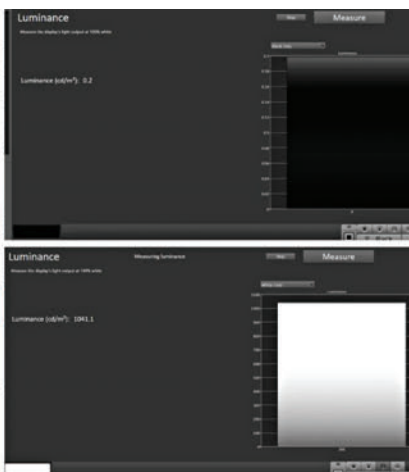

Currently, there are plenty of automatic calibration features on this TV. Some examples include the studio-calibrated modes for Netflix, Amazon Prime Video, and Sony Pictures Core. The TV also features a My Cinema Preset that automatically calibrates the audiovisual settings to match the room conditions and the creator's intention. There is a button for this preset on the remote.

The remote is handy because of its lightweight, not-so-long length, lean build and the textured finish on the sides and back. Besides the regular buttons, you get a hotkey for Sony Pictures Core, JioHotstar, Netflix, Prime Video, SonyLiv and Crunchyroll. In case you don't want to go through the Google TV settings menu, the remote offers a button up top that shows an overlay of key settings like picture, audio, network, etc. One qualm is that the bundled remote isn't backlit, which may matter while using it in a dark room.

WORTH BUYING?

Ultimately, in true Sony fashion, the Bravia 7 II is not a TV you buy because it offers the longest feature list for the money. You buy it for Sony's image processing, colour tuning and overall picture quality. The rest of the package is solid and contributes to a genuinely premium viewing experience. If those are the qualities you care about most, and you're willing to pay extra for Sony's refinement, the Bravia 7 II is worth it.

—G. S. Vasan
