

do not have to stretch your arm too far to fit more people into the photo. Autofocus also helps keep faces sharp. Selfies have plenty of detail in good lighting, and skin tones look natural.

Oppo has also added several camera features aimed at social media users and content creators. AI Remix Collage is one of my favourite tools that lets you combine photos into more creative layouts. Different filters and shooting options inside the camera app are fun to experiment with. More importantly, they are built directly into the phone. You do not need a separate editing app for every effect. Neat!

In a nutshell, the Oppo Reno 16 has one of the most versatile camera setups in its segment. If cameras and creativity are your priority, the Reno 16 gives you plenty to work with.

DISPLAY

Now, let's talk about the display. The Oppo Reno 16 features a 6.32-inch FHD+ display with a smooth 120Hz refresh rate and 3,200 nits of peak brightness. The display quality is quite impressive,

to say the least. Colours look bright and lively, and the screen has enough sharpness for everyday use. I watched several videos and spent a fair amount of time scrolling through social media on the Reno 16. The overall viewing experience was really good. Dark scenes look deep, while colourful content has the right amount of pop.

I also tested the display using Calman and the SpectraCal C6 Colourimeter, and it recorded an average Delta E of 1.6, which is really good. In

simple words, this means the display is able to reproduce colours quite accurately. It recorded almost 100 per cent gamut coverage in the sRGB colour space, which is excellent. This means the screen can show a wide range of colours, something you will immediately notice while watching content or looking at photos.

I was also quite amazed by the phone's real-world brightness. Now, if you don't know by now, when smartphone makers claim big peak brightness figures, it usually just means a tiny cluster of pixels hitting that limit during specific HDR scenes. What actu-

ally matters is High Brightness Mode, or HBM. This is the sustained brightness your screen kicks into when you step outside. And so, in the Digit Test Labs, I pulled out our lux meter to test the real-world output, and the results are fantastic. On a standard white screen YouTube video, the Reno 16 clocked 1,760 nits. When I pushed it with an HDR white screen video, it hit a massive 2,900 nits.

For perspective, these are incredibly high numbers for everyday use.

As a matter of fact, this screen is literally trading blows with ultra-premium flagships like the Galaxy S26 Ultra and the iPhone 17 Pro Max when it comes to sheer visibility. My point is, with the Reno 16, you will never have to squint to read a text message or frame a camera shot under direct midday sunlight.

VERDICT

After spending a few weeks with the Oppo Reno 16, it is abundantly clear who this phone

is meant for. Of course, being a Reno phone, Oppo has put cameras at the centre of the experience, and the Reno 16 delivers well in this area. But the phone scores well in other areas as well. It has a stylish and compact design that feels comfortable in the hand. The 120Hz AMOLED display is bright and colour accurate. Battery life is another strong point.

Overall, at a starting price of Rs 61,999, the Oppo Reno 16 is a rather solid camera-focused phone that also offers a stylish design, an impressive display and dependable battery life. In fact, with the right card offers and discounts, you can easily get the phone for under Rs 60,000 as well. And, if these are the things that appeal to you and you are actively looking for in a phone, the Reno 16 definitely deserves a place on your shortlist.
