

IPS LCD panels with HD+ resolution and a 120Hz refresh rate.

On a positive note, at least, these are not 90Hz displays. But, since both use HD+ resolution, neither display looks particularly sharp compared to Full HD+ AMOLED displays that come in more expensive devices. That said, both panels are perfectly usable for everyday tasks. Scrolling is smooth while touch response remains quick during gaming and navigation.

In terms of brightness, both are very similar. In our testing at Digit Test Labs, OnePlus N6 reached around 1,070 nits, while Motorola reached up to 1,300 nits in High Brightness Mode. This means, while both phones are somewhat usable in harsh sunlight, just don't expect them to be as bright as their AMOLED counterparts.

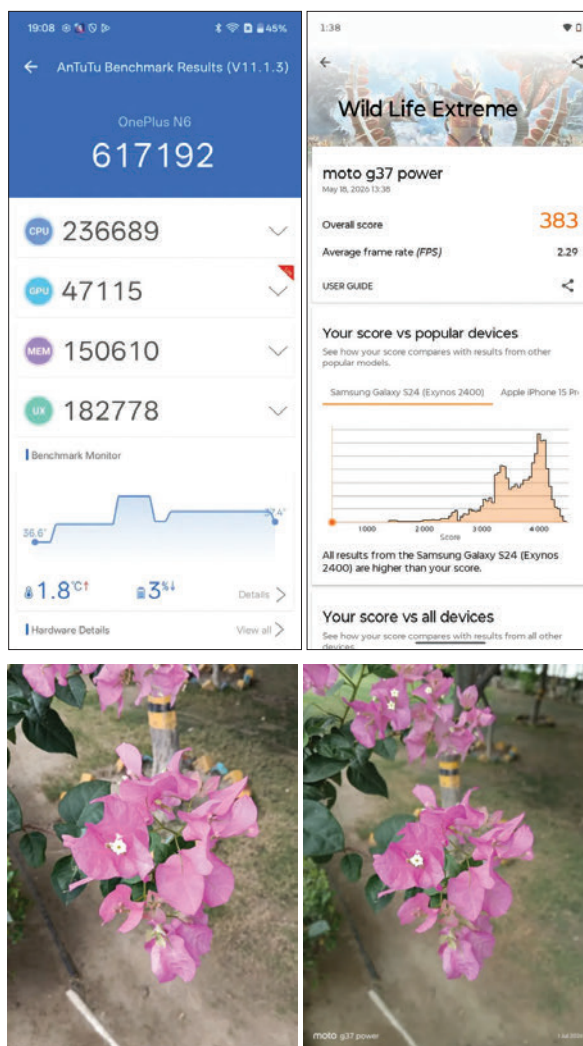

I also noticed a difference in the colour tuning. The OnePlus N6 produces colours that look slightly more natural, while the Moto G37 Power's Display Colour Boost feature increases saturation to make photos and videos appear richer and have more contrast.

Software

The OnePlus N6 runs OxygenOS 16 based on Android 16, while the Moto G37 Power ships with Android 16 alongside Motorola's Hello UI.

OxygenOS continues to be one of the better Android interfaces available. Navigation feels smooth, animations are well-tuned, and multitasking remains responsive throughout the system. OnePlus has also added several AI-powered tools, including AI Eraser, AI Reflection Eraser, and AI Unblur. These features add some extra functionality in everyday use.

Motorola has traditionally offered one of the cleanest Android experiences, and Hello UI continues that approach. The

OnePlus N6

Moto G37 Power

interface stays close to stock Android, making it simple to navigate even for first-time users. Motorola's gesture controls and customisation options also remain some of the better implementations in this segment. That said, Motorola has started including more pre-installed apps than before. Newsroom, recommended games, and a few third-party applications now come installed by default. They can be removed, but it's still something worth mentioning.

OnePlus also includes some pre-installed apps, although the overall experience still feels slightly cleaner on the Motorola.

The OnePlus N6 will receive two major Android updates along with three

years of security updates. With the G37 Power, Motorola promises one major Android update to Android 17 and three years of security patches. Neither policy is industry-leading, but OnePlus clearly offers the better long-term support.

Camera

The OnePlus N6 comes with a 50MP primary camera paired with a depth sensor. Selfies are handled by an 8MP front camera. The Moto G37 Power also features a 50MP primary sensor alongside a depth sensor and an 8MP selfie camera.

Starting with daylight photography, both phones produce images that are more than good enough for social media and everyday use. Colours look pleasing, dynamic range is acceptable, and exposure remains fairly consistent across different lighting conditions.

However, after comparing photos side by side, the OnePlus N6 produces slightly sharper images. Fine details are retained better, and close-up shots generally look cleaner on the N6.

When it comes to selfies, the OnePlus N6's front camera produces selfies with more neutral colours, while the Moto G37 Power tends to brighten faces slightly. Some users may prefer Motorola's processing, while others may find OnePlus looks closer to real life.

In video recording, the Moto G37 Power supports up to 2K resolution at 30fps. The OnePlus N6 is limited to 1080p at 60fps. **[d]**
