### Claude cracked a lab's raw chemistry data in under 25 minutes

An Anthropic tested whether Claude could handle a routine but time-consuming chemistry task: confirming a molecule's identity and purity from raw NMR and LC-MS instrument files. Given only the files and a one-line prompt, no vendor software, Claude delivered NMR results in 23 minutes and LC-MS results in 19, run simultaneously. Its purity figure (96.4%) closely matched the lab's (96.33%), and hydrogen counts were accurate to within 0.08. It even decoded an unfamiliar vendor file format and correctly predicted a follow-up deuterium oxide test the lab later ran, later correcting its own peak interpretation once new data arrived. The lab's full report took four days; Claude matched it in 25 minutes. This is now available via Claude Science. [tinyurl.com/97e82cd](https://tinyurl.com/97e82cd)

### OpenAI Astra: Critical cybersecurity threshold explained

OpenAI paused scaling its frontier model Astra after signs it could cross cybersecurity risk thresholds in its Preparedness Framework, following a Hugging Face security breach. It halted reinforcement learning training for two weeks, delayed its largest planned training run, and moved Astra work to its highest security tier. New monitoring flags suspicious behavior within 30 minutes, escalating to safety, security, and research teams, costing roughly 20% of inference compute. ### OpenAI launches GPT 5.6 Cyber AI model, expands cybersecurity service Daybreak

OpenAI has expanded its Daybreak cybersecurity initiative with two tiers, Blue and Red. Blue focuses on defensive tasks such as incident response and malware analysis, while Red supports

advanced security testing and vulnerability research. OpenAI has also introduced GPT 5.6 Cyber, a model for exploit development and zero-day vulnerability. [tinyurl.com/d89eu2rf](https://tinyurl.com/d89eu2rf)
