

The colour measurements are also strong. Our Calman test recorded 99.35% coverage of the DCI-P3 gamut using CIE 1931 xy and 99.45% using CIE 1976 u'v'. BT.709 coverage was 100% in both measurements. These and the 83% BT 2020 coverage are either better or comparable to the LG G5's scores.

THE BUILT-IN SPEAKERS

The LG OLED G6 has a 4.2-channel, 60W speaker system with Dolby Atmos support. LG also includes AI Sound Pro and WOW Orchestra for pairing the TV with a compatible LG soundbar. For most users, the speaker output should be more than adequate. Dialogue is clear, voices remain easy to follow, and there is enough volume for a reasonably large room. The sound also has more body than you might expect from such a thin television.

But if you are buying a flagship OLED TV, you probably have a good soundbar or the money to buy one.

A dedicated and capable soundbar can create a huge sense of cinematic scale that a built-in TV speaker would struggle to produce.

VERDICT

Traditionally, peak brightness has been a weakness of OLEDs but LG has solved that with its latest flagships, and the G6 in particular. You are getting a supremely bright display that also delivers the deep blacks you come to expect from an OLED. Save for some exceptions with skin tones, the LG OLED G6 produces very accurate colours, too. Any differences still remaining are subtle and not something I would call a problem.

Sure, as a critic, I can still find certain shortcomings. There is some banding in demanding scenes; brightness can occasionally make parts of an image look more intense than they should, and there are small inconsistencies that become visible when

you actively look for them. The Magic Remote can also be erratic, and the software experience isn't as open as increasingly tied to LG's ThinQ ecosystem.

But as a user, the LG OLED G6 is much easier to recommend. The extra brightness is genuinely useful, particularly in HDR content and bright rooms. It handles daytime viewing better than many OLEDs, retains the deep blacks that make OLED special, and works equally well for movies, sports, and gaming. The four HDMI 2.1 ports and 165Hz VRR support also make it a very reliable gaming TV. All in all, it offers an impressive experience across a wider range of content and conditions.

So, for Rs 2.3 lakhs, you are getting a plenty bright, versatile, and easier-to-live-with OLED TV that produces a much more natural-looking picture than it has done ever before. The LG G6 is therefore one of the most complete TVs I have tested this year.

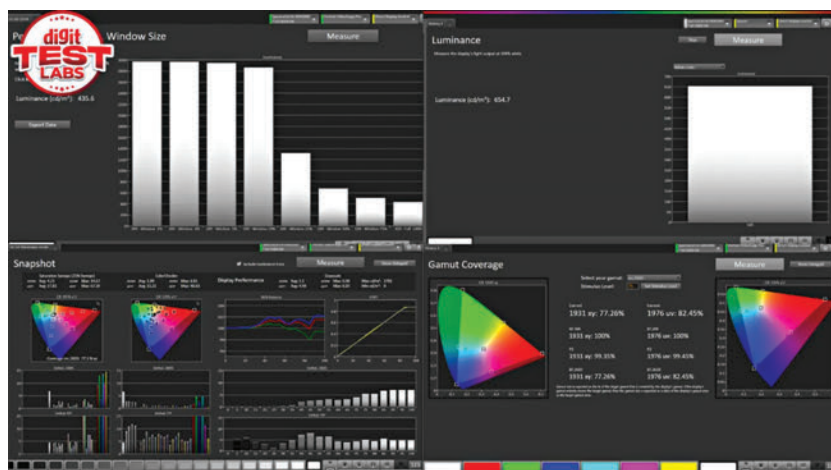

– G S Vasan

SPECIFICATIONS

Display: 65-inch 4K OLED | Refresh Rate: 120 Hz Native (VRR 165Hz) | Picture Processor: Alpha 11 AI Processor 4K Gen3 | AI Upscaling: Alpha 11 Super Upscaling 4K | HDR: Dolby Vision/HDR10/HLG | Response time: 0.1 ms | OS: webOS 26 | Audio Codec: AC4, AC3, EAC3, HE-AAC, AAC, MP3, PCM | Speaker system: 4.2 Channel | AI Sound: Alpha 11 AI Sound Pro
