

relevant conversation. The app keeps things relatively clean, with transcripts, summaries, and action items presented without unnecessary clutter. This is particularly useful if your work involves a lot of meetings, interviews, or events.

RECORDING

Despite everything the Neo 1 does well, I still had to use a separate recording device during important conversations. The reason is simple: it does not give you the original audio back. Once it has processed the conversation, you are left with the transcript and some AI-generated information.

That is fine when you only need to remember what was discussed. But during an interview, sometimes a summary is not enough. You may want to hear exactly how someone said something, understand the context behind a statement, or check a particular word. I would like Neosapien to add a recording option, because having the original

audio alongside the AI notes would make the device much more useful.

APP AND CONNECTIVITY

Pairing the Neo 1 with the app is simple, and the overall interface is clean. There is also a desktop app for Windows and macOS that can capture audio from your computer for services such as Zoom, Meet, and Teams without needing a bot to join the meeting.

However, I did notice some syncing issues, and there were also moments when the device randomly went to sleep. Another limitation is that integrations are still a work in progress. I would like to see the Neo 1 automatically push notes into apps such as Notion or directly update tasks and CRM entries.

PRIVACY

A device that listens to conversations will always raise privacy concerns. While the company says raw audio is deleted after transcription and that data

is encrypted both in transit and at rest, its privacy policy also identifies several categories of third-party services that may process user data, including payment providers, logistics providers, AI partners, and cloud storage providers.

The company also says it regularly audits and tests its systems for vulnerabilities, although the privacy policy does not publicly identify any third-party security agencies or provide detailed audit reports. It further states that user conversations will not be used to train AI models unless the user explicitly opts in to such use.

VERDICT

The Neo 1 is an interesting product because the idea behind it works. I found myself saving time while covering events and searching for quotes, and the quality of its transcripts and summaries was better than I expected.

But there are too many compromises for me to call it a complete product. The battery life needs improvement; the device can go to sleep unexpectedly; the build quality doesn't feel premium; the chain is inconvenient, and Android syncing needs more work. The inability to access original recordings is also a serious limitation.

At Rs 12,999, I would recommend the Neo 1 if your day revolves around meetings, interviews, events, or conversations that you regularly need to remember. If you rarely have such use cases, you may struggle to justify the price.
