

Purify app also lets you set a timer for one, two, four, or eight hours, enable the child lock, adjust the brightness of the display and indicator LEDs, and check the remaining filter life. You can also access a few other settings from the app, giving you more control over the purifier without having to use the physical controls.

Air purification performance

Going by the claims in Wozoyo's spec sheet, the PA6 had a lot to prove. A claimed coverage area of up to 2,915 sq. ft. and a CADR of 700 m³/h are impressive figures, especially for an air purifier in this price range. Wozoyo also claims that its four-stage filtration system can remove 99.99% of PM2.5, PM10, pet dander, pollen, smoke, dust mite debris, and other microscopic particles.

I first tested it in our Digit Test Lab, where it worked without any issues. Then I decided to take the PA6 home, where I could test it in a realistic domestic environment. My apartment is around 1,100 sq. ft., and I placed the PA6 in the living room for my testing. I kept all the windows and doors closed and the PA6 started with a PM2.5 reading of 310 µg/m³. I deliberately first left the purifier run in Auto mode to see how quickly it could bring the pollution levels down and how it would adjust the fan speed on its own.

The PA6 brought the PM2.5 level down to 259 µg/m³ within the first five minutes, and then continued to bring

it down to 145 µg/m³ at the 10-minute mark. After 20 minutes, the reading kept moving between 115 and 140 µg/m³, while after 30 minutes, it stayed between 105 and 114 µg/m³. Once the PM2.5 level went below 150 µg/m³, the purifier automatically lowered the fan speed. At the one-hour mark, the reading had dropped to 63 µg/m³, and after running it for longer, it eventually settled around 30–35 µg/m³.

I repeated the test on multiple occasions, and the overall performance remained largely consistent. The exact numbers varied depending on the starting PM2.5 level, but the PA6 followed a similar pattern almost every time. It brought the levels down quickly

at first and then gradually reduced the fan speed as the air became cleaner.

To see how it handled maximum airflow, I switched the PA6 to Turbo mode. Even at its highest fan speed, it took around 10–12 minutes to bring the PM2.5 level down by 50 percent. However, the rate of reduction remained fairly consistent as the air became cleaner, and the purifier continued bringing the PM2.5 level down steadily.

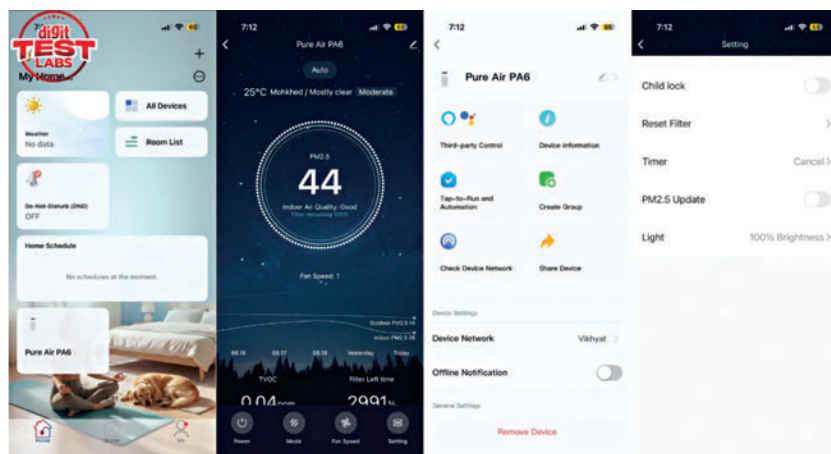

I also kept a separate AQI monitor running alongside the PA6 during my testing. On the first day, there was a difference of around 10–15 points between the readings, and that remained the case for most of my testing. However, the difference wasn't always consistent. For example, on the 15th day, the gap between the two readings was almost double what I had usually seen. Both devices still showed the same trend as the air quality improved, but the difference in readings was noticeable.

Should you buy it?

After using the Wozoyo Pure Air PA6 for the last few weeks, I came away impressed by its core performance. It consistently brought down high PM2.5 levels in my 1,100 sq. ft. apartment, and Auto mode did a good job of adjusting the fan speed as the air became cleaner.

There are a few things that could have been better. The purifier is fairly heavy, and wheels would have made it much easier to move around. The app is useful and packed with controls, but the difference of around 10–15 points between its air-quality readings and those on the purifier can be confusing.

At around Rs 25,000, the Wozoyo Pure Air PA6 faces plenty of competition, but its 700 m³/h CADR, large coverage area and consistent purification make it a strong option for larger spaces. If you live in a part of India where an air purifier needs to run for much of the year, the PA6 is worth considering. **4**
