

$$\text{BREAK EVEN POINT} = \text{STRIKE PRICE} + / - \text{TOTAL PREMIUM.}$$

In this case, we want the price to move beyond the range of ₹1820 – ₹2180. The lower limit here is the ₹1820 (₹2000 – ₹180). For us to have success with this strategy, we want the price movement to be below this lower limit.

Alternatively, the upper limit is ₹2180 (₹2000 + ₹180). Again, we want the price to cross this upper limit.

In this strategy, we are not forecasting the direction of the movement. We are just trading based on our assumption of high volatility.
