

How to write agent-ready prompts

Turn vague requests into powerful task briefs

In the chatbot era, prompting felt like asking a question. You typed, “Explain mutual funds,” “Write a leave letter,” or “Summarise this article,” and waited for the answer. With AI agents, the prompt becomes something more serious. It is no longer just a question, it’s a project brief.

That shift matters because agents do not merely respond. They may read files, browse websites, analyse spreadsheets, draft emails, create tables, organise tasks, write code, update documents, or prepare a plan across several steps. A vague prompt that was harmless with a chatbot can become risky with an agent. “Plan my trip” may produce a decent itinerary. But if

the agent has access to your calendar, email or booking tools, vague instructions can create confusion, wrong assumptions and unnecessary actions.

Always remember: do not prompt agents casually. Brief them clearly.

Why normal prompts fail with agents

A normal prompt often fails because it leaves too much unsaid. Humans fill gaps using common sense, context and lived experience. AI agents guess. Sometimes they guess well, other times they confidently guess wrong.
