COMPLEX AUTOMATION

On the first Monday of every month, perform a series of web searches to gather information on the 'I ah-Grown Diamond' market.

COMPLEX AUTOMATION

Plan a surprise 30th birthday party for a friend who loves hiking and craft beer. The plan should include: researching and suggesting three

COMPLEX AUTOMATION

Outline the steps to create a personal finance dashboard using Google Sheets and a service like Plaid to connect to bank accounts.

For example:

“Create 20 Instagram reel ideas for a Hindi-English tech channel explaining AI tools to college students. Tone should be practical, slightly witty and not hype-driven. Each idea should include a hook, 30-second structure and CTA. Avoid fear-mongering and avoid generic lines like ‘AI is changing the world.’”

For writers, add voice constraints:

“Write in a clear magazine style with strong opening lines, short paragraphs, Indian examples and no corporate jargon.”

For brands, add banned phrases. Agents often overuse phrases such as “game-changer,” “unlock potential,” “seamless experience” and “revolutionary.” Tell the agent what not to sound like, but also tell it what to sound like instead.

Prompting for coding agents

Coding agents need requirements, environment details and testing instructions.

A weak prompt says:

“Build me an expense tracker.”

A better prompt says:

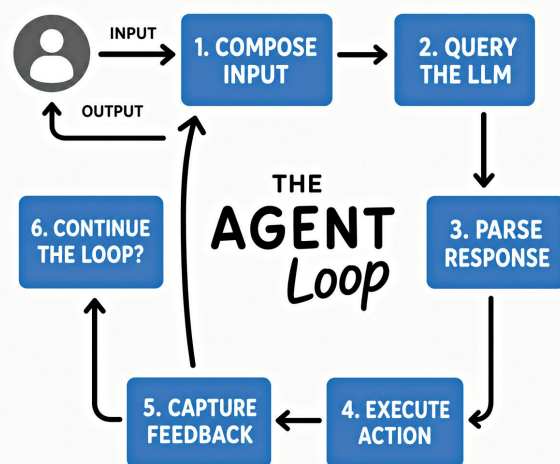

“Build a simple personal expense tracker using HTML, CSS and JavaScript only. It should let users add date, category, amount and note. Show total monthly spend, category-wise totals and a downloadable CSV. Keep the design mobile-friendly. Do not use external libraries. Explain how to run it locally.”

For debugging, include the error message, expected behaviour, actual behaviour, relevant code and what you already tried.

Also ask the agent to explain changes:

“Before giving the final code, explain the bug in simple terms. Then provide the corrected code. Finally, list two tests I should run.”

This keeps you in control. You should not accept code you cannot understand.
