

Step 2: Define allowed inputs

Allowed inputs may include manually uploaded notes, selected emails copied into the chat, meeting transcripts, PDFs, task lists, project documents and spreadsheets. Avoid giving it unrestricted access at first.

Step 3: Define prohibited actions

Write: “Do not send, delete, publish, buy, book, approve, share or modify original files.”

Step 4: Define output sections

Ask for consistent sections: Summary, Tasks, Drafts, Risks, Waiting On, Suggested Next Actions.

Step 5: Define review behaviour

Tell it to flag uncertainty, source conflicts, missing deadlines and personal data risks.

Step 6: Test with old information

Use last week’s meeting notes or an old project update. Check whether the agent understands your style and priorities.

Step 7: Save the working prompt

Once the output is useful, save it in your prompt library. Improve it every week.

Personal admin agent master prompt

Use this as your starting template:

“Act as my Personal Admin Agent. Your role is to organise information, reduce clutter, draft useful outputs and help me decide next steps. Use only the information I provide in this chat or approved files. Do not access, assume or invent missing information.

Your tasks:

- 1. Summarise the input clearly.*
- 2. Extract action items.*
- 3. Identify deadlines, owners and dependencies.*
- 4. Draft any needed follow-up messages.*
- 5. Flag risks, missing details and unclear assumptions.*
- 6. Suggest next steps.*

Rules:

Do not send messages, publish content, delete files, make payments, book anything, change records or share private information. If a task requires any of these actions, stop and ask for approval. If sources conflict, show the conflict. If information is missing, ask or mark it as unknown.

Output format:

Brief Summary

Action Items

Draft Replies

Waiting On

Risks and Missing Details

Suggested Next Steps.”

This is not flashy, but it is extremely useful.

Student version

A student can adapt the system into a Study Agent.

- **Inputs:** syllabus, class notes, textbook chapters, past papers and deadlines.
- **Outputs:** revision plans, summaries, flashcards, practice questions, weak-area lists and exam timetables.
- **Rules:** do not write final assignments for submission; teach concepts; test understanding; explain mistakes.
- **Sample instruction:** “When I ask for help with a topic, first explain it simply, then give an example, then ask me three questions to check understanding.”

This turns the agent into a tutor, not a cheating machine.

Office professional version

An office worker can create a Workday Agent.

- **Inputs:** meeting notes, project tracker, selected emails, calendar notes and weekly goals.
- **Outputs:** daily priorities, meeting summaries, follow-up drafts, status updates and blocker lists.
- **Rules:** do not send emails or update trackers automatically. Prepare drafts only.

The best use case is the Friday update. Feed the agent your week’s notes and ask it to produce a concise report: completed work, ongoing work, blockers, decisions needed and next week’s priorities.

Freelancer version

A freelancer can create a Client Workflow Agent.

- **Inputs:** client briefs, proposal templates, timelines, invoices and notes from calls.
- **Outputs:** proposal outlines, deliverable lists, follow-up emails, invoice reminders, project plans and revision logs.
- **Rules:** do not reveal one client’s information to another. Do not upload confidential client assets unless permitted. Do not commit to pricing or timelines without approval.

The agent becomes especially useful when tracking multiple small projects, where the hidden cost is not the work itself but remembering who needs what by when.

Creator version

A creator can create a Content Agent.

- **Inputs:** topic ideas, past posts, analytics screenshots, audience notes, scripts and brand guidelines.
- **Outputs:** hooks, outlines, captions, thumbnails briefs, posting calendars, repurposed threads, newsletters and video structures.
- **Rules:** follow voice guidelines, avoid generic AI phrases, do not publish automatically, and always create multiple options.
