

Your AI agent toolkit

Choosing the right agent for every serious workflow

The first mistake people make with AI agents is assuming there is one perfect tool for all tasks. There is none. The agent ecosystem looks less like a single app and more like a toolkit.

Some agents are brilliant at research. Some are built for office work. Some are best at coding. Some sit inside customer relationship management platforms. Some quietly connect apps in the background. The real skill is not signing up for every shiny AI service. The real skill is knowing which agent deserves which job.

A student preparing for UPSC does not need the same agent stack as a D2C founder managing Instagram leads. A journalist handling interview transcripts has different needs from a CA firm chasing client documents. Cost, language support, mobile access, file privacy, app integration and local availability all

matter. Your toolkit should match your reality, not Silicon Valley demo videos.

Types of AI agents

Start by dividing AI agents into six practical categories. Once you understand these categories, choosing becomes much easier.

1. General-purpose agents

The first category is the general-purpose agent. These are the broad assistants inside tools such as ChatGPT, Gemini, Claude and Copilot. They can research, write, analyse files, compare options, create plans and sometimes use external tools. They are best for individuals and small teams who need flexible help across many tasks. If you do not know where to begin, begin here.
