

14 > Choosing the right cloud backup

HomeKit Secure Video support depending on plan level, while allowing Family Sharing with up to five other family members.

Where iCloud+ shines is not value-per-gigabyte in isolation. It shines in frictionless continuity. Your iPhone backs up. Your photos sync. Your files appear across devices. Your Apple ecosystem behaves like it belongs to the same household instead of three politely uncooperative departments. Apple's support documentation is explicit that iCloud Backup creates a copy of device information not already synced to iCloud, while iCloud Photos keeps your photo library in iCloud and synced across devices. Understanding that distinction matters, because iCloud+ is strongest when you embrace the whole workflow rather than treating it as just a bucket of storage.

iCloud+ is the smartest pick for readers who:

- use an iPhone and likely another Apple device
- care about automatic backups and synced continuity
- want family sharing in an Apple household
- appreciate Apple's privacy extras such as Hide My Email and Private Relay
- are willing to pay a little more for lower friction

Hide My Email and Private Relay are not backup features in the strict sense, but they do strengthen the package for users who want their paid cloud subscription to do more than just hold photos. Apple confirms both features can be used by members of a Family Sharing group when iCloud+ is shared. That gives iCloud+ a lifestyle advantage that plain storage comparisons miss.

Where iCloud+ is weaker is obvious: if you are not meaningfully inside Apple's ecosystem, it becomes much less compelling. Yes, you can access some iCloud features outside Apple hardware, but the service is clearly designed to feel most natural on Apple devices. Paying for iCloud+ while living mostly on Windows and Android is a bit like buying a season pass to a club you only visit twice a month. Technically possible. Spiritually inefficient.

Step-by-step: when to choose iCloud+

Choose iCloud+ if most of the following are true:

1. Your main phone is an iPhone.

2. You also use a Mac or iPad, or plan to stay in Apple's ecosystem.
3. You want your backups, photos and files to feel automatic.
4. Your household can benefit from Apple Family Sharing.
5. Privacy extras like Hide My Email or Private Relay appeal to you.

If that list describes your life, iCloud+ is probably the right answer even if another service looks cheaper on paper.

OneDrive: For Windows users who want recovery

OneDrive has an image problem. Many people treat it as the cloud they did not ask for but found preinstalled in a Microsoft ecosystem. That undersells it. For Windows users in particular, OneDrive is often the most sensible cloud choice because it connects naturally to folder protection, Microsoft account recovery flows, and Microsoft 365 subscriptions. Microsoft's India pricing currently lists Microsoft 365 Basic at ₹149/month, Personal at ₹689/month, and Family at ₹819/month. Microsoft 365 Basic includes 100GB of cloud storage for one person, while Personal and Family expand storage and bundle broader Microsoft app benefits.

The real strength of OneDrive is that it does not just sell storage. It sells recovery and workflow continuity. Microsoft says OneDrive files can be recovered for up to 30 days after malicious attacks, file corruption, accidental deletes and edits in relevant subscriber scenarios, and its "Restore your OneDrive" feature can roll back the entire OneDrive to a previous point in time within the last 30 days for Microsoft 365 subscribers. That is a substantial safety net for people who work inside Office files, sync important folders, or worry about ransomware and accidental damage.
