

Windows backup done right

Backup Windows properly before it betrays you

Windows users have a habit of discovering backup in the least dignified way possible. A laptop refuses to boot. An SSD goes theatrical and vanishes from File Explorer. Someone resets the PC to “fix performance” and accidentally punts half their life into oblivion. Or, more commonly, a new Windows laptop arrives and the old one suddenly becomes very interesting because it contains three years of documents, family photos, tax PDFs, saved Wi-Fi passwords, browser settings, app preferences, and one Desktop folder being used as a substitute for long-term memory. Microsoft clearly understands this chaos. Its official Windows

Backup documentation says Windows can back up files, themes, settings, many installed apps, and Wi-Fi information to help protect what matters and make moving to a new PC easier.

Microsoft says Windows Backup can protect several categories of data: your files, many installed apps, settings, themes, Microsoft Edge preferences, saved Wi-Fi information, and other Windows preferences. It can be configured either from the Windows Backup app itself or from Settings > Accounts > Windows backup, and Microsoft provides a settings catalog that breaks down what can be backed up. That matters because Windows Backup is not simply “copy every byte from my SSD
