

Separate Digital Identities

Build separate identities without losing control

Most privacy failures begin with convenience, not sophisticated hacking. You create a gaming account using your main email, reuse a LinkedIn photograph, attach your everyday phone number and later use the same username on a public forum. Together, these choices build a bridge from a supposedly separate identity to your legal name, workplace and contacts.

Identity compartmentalisation divides online activities into contexts with separate purposes, identifiers, accounts and rules. Your bank should not share an identity with a meme account.

A professional profile should not reveal the handle used for a sensitive hobby.

The goal is not to become a different fictional person every hour. It is to prevent unrelated parts of your life from being linked simply because one company, stranger or data leak contains a common identifier.

Start with roles, not applications

Many people organise accounts by service. A privacy-conscious system begins with roles. Ask what you are doing, who must recognise you and what would happen if the activity became public.
