

Browse without being Followed

Browse more privately without mistaking privacy for invisibility

Opening a webpage looks like a conversation between you and one website. In practice, the page may load advertisements, analytics scripts, video players, social buttons, fonts and images from several other domains. Each request can disclose information about your browser, network and behaviour. Visit enough pages and those fragments can become a history of interests, purchases, health concerns, political reading and daily routines.

Private browsing is therefore not one switch. It involves limiting what websites store, reducing what third parties can observe, separating identities and recognising what remains

visible. The objective is not to make every webpage forget you completely. Many sites need temporary information to keep you logged in, remember a basket or retain accessibility preferences. The objective is to stop convenience mechanisms from becoming permanent tracking mechanisms.

Understand the trails inside a browser

A first-party cookie is created in the context of the site you intentionally visit. It may preserve a login or language setting. A third-party cookie belongs to content embedded from another domain, such as an advertising or social-media service. Chrome's
