

Laptop & AI-PC Landscape

AI copilots on board: NPUs are reinventing your laptop

For the first time, Windows laptops now come with an “AI PC” designation, in case you haven’t noticed. Microsoft’s new Copilot+ PC label is being applied to laptops that meet strict AI hardware criteria, signaling they can run advanced on-device AI features. This badge isn’t just marketing fluff – it denotes a laptop packing specialized AI silicon and optimizations for things like local Windows Copilot assistants, real-time translation, AI image generation, and more.

In short, a Copilot+ PC promises a next-level experience where your laptop can think and assist intelligently without offloading everything to the cloud.

So what exactly does that mean for you as a buyer in 2025? It means the laptop landscape is evolving beyond just CPU and GPU speeds. An NPU (Neural Processing Unit) has now entered the mix, becoming as important as a good processor or graphics card for certain users. Many of the cutting-edge features in Windows 11 – from natural-language file search (“Recall”) to live voice captioning with translation – require this new kind of chip. These AI features run locally on the NPU, giving you faster responses and better privacy compared to cloud-based AI services. A Copilot+ PC, therefore, is essentially a guarantee that the laptop has the smarts (and the parts) to handle modern AI-driven tasks efficiently and offline.
