

Home Assistant weekend builds

10 automations that convert skeptics

Home Assistant is what happens when you stop treating your home like a folder of apps and start treating it like a system. It's local-first, automation-native, and built for people who'd like the lights to keep working even when the internet doesn't.

This chapter is a practical weekend build: install Home Assistant OS, finish onboarding, create one "daily driver" dashboard, set up backups, then add your first Matter devices locally (including Matter-over-Thread if you're ready).

The weekend plan (so you don't spiral)

Saturday

1. Install Home Assistant OS
2. Onboarding + naming + areas
3. First integrations (phone + basics)
4. Build a dashboard you'll actually use
5. Make a backup

Sunday

1. Install Matter (supported path)
