

India's smart home moment is here

A few years ago, “smart home” in India mostly meant a Wi-Fi bulb you showed off to guests like it was a new family member. In 2026, it’s turning into something far more practical: homes that save time, cut waste, and feel safer – without needing a Silicon Valley-sized budget or a full-time IT admin.

Start with the boring-but-important backbone: connectivity. India’s active internet user base hit 886 million in 2024, and the real headline is rural India – 488 million users – now outnumbering urban (397 million).

And if you want a single number that explains why every brand wants to live inside your living room: India’s broadband subscriber base crossed 1 billion in November 2025, per TRAI. Add smartphones as the remote controls of modern life – IDC pegs India’s smartphone shipments at 151 million units in 2024 (up 4% YoY). That’s a massive installed base for apps, voice assistants, QR onboarding, and notifications that actually reach you.

Now look at what Indians are buying *inside* the home. Smart TVs – arguably the most common “hub” after your phone – shipped 12.1 million units in 2024, growing 8.6% YoY, with a 43% jump in 55-inch+ TVs (because subtlety is dead and we all want cinema).

Appliances are also marching toward “connected by default”: IBEF estimates India’s overall appliances market at ₹2,68,915 crore (US\$30.8B) in 2024, projected to reach ₹4,05,118 crore (US\$46.4B) by 2030. Even the router – the unglamorous box that decides whether your automations work – has become a category with momentum: one industry estimate puts India’s router market at US\$873.8M in 2024, heading toward US\$1.73B by 2033.

Security is the other big driver, because “peace of mind” sells in every pin code. One forecast pegs India’s smart home security camera market at US\$350.9M in 2024, expanding to US\$2.28B by 2033. Counterpoint’s earlier data already showed how price is pulling this category into the mainstream: in Q1 2023, shipments were up 48% YoY, and 75%+ cameras sold were under ₹3,000.

Put it together and the macro picture looks loud: multiple analysts now place India’s smart home market around US\$6–6.7B in 2024, with aggressive growth

expectations through the decade (Grand View, for example, projects US\$33.45B by 2030).

That’s exactly why this Fast Track exists. Because when a market moves this fast, it’s easy to buy chaos – ten apps, three hubs, one router meltdown, and a family that hates you. Over the next 20+ pages, we’ll build your smart home the India-first way: planned, safe, scalable, and delightfully DIY. Happy smart home upgrades! **d**
