

your devices via a peer-to-peer protocol. That means you get the power of a connected workspace – with zero data-mining. Anytype is still in active development, but it’s already robust enough for planning projects, managing personal knowledge, and building a digital second brain. Bonus: it works offline.

Anytype allows you to build complex, linked databases and content types (called “Objects”) – like Projects, Habits, Goals, or even your own Journaling templates – all completely offline, with no need for an internet connection until you sync.

2. AppFlowy

Platforms: Android, iOS

Open-source Notion alternative for those who prefer data privacy and offline-first design. AppFlowy mimics the modular workspace magic of Notion – drag-and-drop blocks, collaborative docs, custom pages – but all the data is yours. It’s built with performance and privacy in mind, and because it’s open-source, you can host your own backend or just run it fully local. It’s also surprisingly polished for a young app, with support for mark-down, task lists, kanban boards, and more.

AppFlowy is fully extensible – developers can add plugins in Flutter and Rust to customize the interface or add new block types, making it a rare mix of simplicity for users and flexibility for power users.

3. Notesnook

Platforms: Android, iOS

Zero-setup, encrypted note-taking that just works. Notesnook may look minimal, but under the hood it’s one of the most secure and intuitive note-taking apps available. All your notes are end-to-end encrypted by default, and sync across devices with a clean, frictionless interface. It supports rich text, tables, math blocks, file attachments, tags, and even bidirectional links. The design feels familiar if you’ve ever used Evernote – but lighter, cleaner, and without the clutter.

One of its coolest features is that it includes a built-in “Private Library” mode that lets you hide specific notes behind an additional password layer – great for sensitive material like IDs, financial notes, or journal entries.

4. Habitica

Platforms: Android, iOS

Because leveling up in real life is more fun than checking a boring checkbox. Habitica is a to-do list gamified. You create tasks, goals, and habits – then gain XP and gold when you complete them. You lose health when you procrastinate. It adds layers like pets, quests, and gear upgrades to make habit-building addictive (in a good way). You can even join a party with friends and battle monsters by completing your daily habits. For many, it’s the *only* task manager that’s ever stuck.
